Give me a break! And just what have you done to contribute to the "atari race" lately? William, OTOH, has written some very nice and I might add, needed software for Atari's.

Any computer is just a means of getting something done. I happen to like my TT. I also use PC's at work because the PC world has software the that does not exist in the Atrari world. I would seriously suggest that you either 1) Get a life or 2) crawl back under what ever rock keeps daylight from shining on you.

Yes, but I turn ON Bus Arbitration when I use my CD-writer and turn OFF
when I used CAF. Very easy with bootconf.

Apple has been around for over 20 years. That's a long time for a computer manufacturer. I don't think they'll be disappearing any time soon.

Well, actually, a newsgroup's main purpose is to get people in contact
with other people sharing the same interest. I suppose that anyone who
is reading this group is interested in the Falcon. Usually people have a
specific question to ask or something interesting to say. I always find
it strange to find someone coming in and saying "Hi, if you're
interested in the Falcon send me an email instead of reading this
group".

Cheers,
Nick

>> are disks formatted on the Atari able to be read by the IBM?
>NO !

The built in formatting programme in TOS is a bit random, use a formatting program or a good copy program like FCopy to format your disks MS-DOS compatible. Then you can read them on all IBM-PC clones AND on all Macintoshes.
If you can't read them still you probably have damaged disks or diskdrives. A common problem is that people use 1.44Mb HD disks and formats them to 720Kb DD disks, and this doesn't work all of the time.

I replied, but the mail got bounced because your domain couldn't be
found (tell your postmaster about it).

Here's what I wrote to you.

Hello Terry,

on Wed 01-07-98 19:50 you wrote:

>However, I did notice that all of these groups require long filenames, and
>none of my working groups do. I suspect that a part of Okami's code does not
>handle long filenames and that's what's causing the problems. Of course,
>that could be a coincidence.

You have hit the nail right on its head. The problem is caused by the
way your OS handles long filenames. You see, Okami doesn't do any
truncating in the newsgroup/directory names, it presents them as they
are and leaves it to the operating system what to do with them.
Apparently your OS doesn't handle them correctly. There is nothing I
can do about that. I compiled the same code under UNIX and everything
(in this respect) works fine. It works fine with old single tasking
TOS, etc.

>Please let me know if you have any ideas. I'm hoping I won't have to turn
>off long filenames for that partition, but I guess I will if I have to.

Try that and see how it works. If it works, maybe you should use a
separate partition for Okami alone.

It will
> only be compatible with old amiga apps through emulation. The OS will be
completely

Are you saying that if a new ST was released it would have to be 100%
backward compatable with the old eighties designed hardware ?.
Emulation is a great solution for backwards compatability.

> new and based on a outside developed kernal like BeOS, or Mach. This you
can already

The kernal will "borrow" parts from other OS's, a lot of the features of
workbench will be retained and enhanced further.

> be done under Linux. It will not include a Motorola CPU, it's probably
going to use
> intels comming Merced chip, or something else shitty. The "new" amiga
which will be

Definately not Merced or anything Intel.

> like a bridge to the new platform which will be released later this year
will be
> based
> on the Pentium, so it's clear that they will go for the x86/intel line
like everyone
> else. Don't forget that Gateway has only made intel boxes and never even
seen a PPC.

Gateway wouldn't pay $40 mill for a virtually dead platform with only a
small user base and then spend money on redevelopment to sell rebadged

PC's. Who'd buy them ?, Amigans certailny wouldn't and neither would Joe Blow.

>
> Basicly it's a completely new computer and OS with the Amiga name on it. It's like
> buying a PC whith the Commodore sign on it. It has got nothing at all to do with
> Commodore.

It's for real dude, and it's an Amiga and it's not a PC.
I can't see a PC being 5-10X faster then the current PII by end 1999.

Besides, what the hell is the problem with having another alternative to Intel ?.

Sour grapes ?
:-)

Regards,

Clockmeister.

The Alpha 21264 is, esp. on the floatingpoint part. Integer
specs are a bit less. And this processor is shiping now. It's
not some magical vapor ware like Intel Merced or a 'quantum
processor' to be released in 1999. It is simply the fastest
processor available.

Bye, Hans

hi david,
ii¿½ll try to answer your questions:

1) sorry, no experiences in that stuff.... :-(

2) last version of NVDI is 5.0

3) last version of MagiC is 6.0

please keep in mind ii¿½m talking about the german software versions. but
it shouldnï¿½t take long to get this versions available in english - if
not happend yet.

ciao -micha-

1963. SM125

Newsgroup: comp.sys.atari.st
Date: 1998-07-03 00:00:00 UTC
From: nospam.blackwell@virgin.net
Message-ID: <6nik0jlr1@nclient3-gui.server.virgin.net>
Source record: 97965

Could anyone please send me a schematic (.img .gif or whatever) of an Atari SM125 mono monitor please?

Mine is exhibiting low eht with a barrel effect, and I reckon it's the line output transformer, which leads me neatly on to the next question: Can anyone please tell me where I could obtain a spare, or where I could pick up a junked SM125 cheap?

I'm in Somerset, UK.

john.blackwell@nospamvirgin.net (remove "nospam" to reply.

Incidently, I do have an img of an SM124 schematic if anyone would like.

Many thanks

1964. lastest MagiC

And it's not a Amiga.

> I can't see a PC being 5-10X faster then the current PII by end 1999.

5-10x times faster than what? A sluggish 266MHz P2, or a 400MHz? I wonder
how they define "todays PCs"?

And which is this mysterious CPU?

> Besides, what the hell is the problem with having another alternative to

The current Alpha (available since last year) is 4-7 times as fast
as a P2. Next one out next year will be between 8-15 times as fast.

Papyrus 5 owers in the USA

I would like to ask the USA owner's of Papyrus 5 if they received an
American dictionary with their upgrade?

My experience was I received a British dictionary with my Papyrus 5
upgrade.

I understand that many folks are unaware of the subtle differences between
American and British spelling.

Here are a few words to help you determine if you are using an
American or British dictionary with your Papyrus upgrade.

American British
==========
center centre
civilization civilisation
color colour

The files extention name has changed for the dictionary from DIC to MLX.
The old DIC will not work with Papyrus 5.

If you find that you only have a british dictionary.
Contact your USA dealer and Systems Solutions.

Nothing wrong with your English. I just wasn't sure.

>> So you're saying there's NO WAY to access groups with names longer than eight
>> characters? Wow, that covers a lot of groups. How did that get by them?
>
>Not completly "no way", there are restrictions.
>
>Well, it's perhaps specific to Falcon ?

Please explain.

FYI, I just turned off VFAT for the partition that holds my messages,
did an import, and so far all of my groups are working, including
those with long names.

I guess the only problem would be if using two groups with similar
long names (i.e. the first eight chars. match). When they're
truncated by the 8+3 file system, they'll have identical names.

Hi,
Your best bet is get a hold of the new E3+. It sells for less that
149 US$
and it is an excellent scanner, much better than the E330/V300 (Europe
vs North Am)

There is also support for UMAX scanners such as:
ASTRA 12X0 SCSI
VISTA S6/S12
PowerLook 2

There is currently no support for the lower end UMAX ASTRA 600S/610S,
but
hopefully in a week or two, there will be.

For more info, please contact Homa Systems at

j> any truncating in the newsgroup/directory names, it presents them
j> as they are and leaves it to the operating system what to do with
j> them. Apparently your OS doesn't handle them correctly.

Hmmm...they are written as long filenames to disk. I would think that Okami would be able find them as such.

>> Please let me know if you have any ideas. I'm hoping I won't
>> have to turn off long filenames for that partition, but I guess I
>> will if I have to.
j>
j> Try that and see how it works. If it works, maybe you should use
j> a separate partition for Okami alone.

Well, I've done that and so far, so good. I can now open all my groups.

BTW, any chance of having Okami save the message window position? Even an offset or a switch to center it would be helpful. The first column is very difficult to read on my overscan system, so I'm almost moving it to the right whenever I open up a new group.

Thanks.

What do "Dropped" counts in the STinG dialer mean for TCP and Modem 2? These are the only two places where I've seen dropped counts.

Also, what's happening when the modem's send light is very active? Lately I've had times where the receive light is almost solid, normally indicating a very fast connection. However, the send light is almost as active, with my actual received data (according to the CAB display) slowing to a crawl or even stopping altogether. At times it almost looks like the two sides are fighting. ;^)

OK! I picked up for $8.00 (yep that's right! $8.00) an almost
brand new Brothers HL-600 laser printer. This printer came with
a parallel port, but a serial port can be ordered.

I want to put it on my TT/030, so I need to know can I use the
normal parallel port? will it plug right into my printer port
of do I need to get the serial port?

Do I need another cable? my normal printer cable fits on it.

Anyone know about this printer?

I have an idea:

If you have access to a PC and need to transfer files from the MAC to
the Atari and the Atari will read PC formatted disks, then get a
shareware util called MACSEE for DOS and you can exchange the MAC
formatted disk/files to the PC and then onto the ST via the PC DOS
formatted disk. It is easier than Null Modem-ing...

>Steve

You can get away with extended format upt to about 820Kb on some older PCs and under DOS (W95 is less forgiving). Howver, if there are lots of subdirectories on the disk, then the PC is unable to decipher all the ST FAT and the threads get scrambled. Keep everything on root and do not 'shunt' between the two ie lift off the data cleanly once!It is a gamble but often works.

m> (ID #2, ID 0 is the tape drive, ID 1 is the CD ROM), it says
m> "Wrong Device". The green "Ready" light then goes out on the
m> scanner.

You've checked the "Generic SCSI driver" box in DDriver's utility prog? Does ScanX report that it's found an alternative driver when it loads (click on "Use"), have you tried the other driver MTEK_ATA.PRG?

I found that there seemed to be a problem with the SCSI driver in HDDriver conflicting with an auto folder prog so went back to V7.03.

You could also try unticking the Generic SCSI driver box and using Steffen Engle's SCSIDRV.PRG from CBHD or the GEMAR archives.

Speak to 'ya later!

I was unable to connect to Oregon Research's site earlier today (the
link from Hallvard's page), but I found updaters in ftp.funet.fi that
will bring D. Edge up to 2.04 and D. Back up to 3.6.

Does anyone know if there's anything more recent?

Your explanation fits with what I understood. The question is: would it
be quicker to retrieve the whole messages or to examine them before
retrieval ? If the exam takes as long as the actual way or more, it's
not interesting. (hope you understand what I mean)

I don't believe they are supporting Atari stuff anymore.. They has a
great sale awhile back and I think that's all they had.
There are some patch files out there. What version do you currently
have and perhaps someone can give you a ftp site to download them
from.

But I believe the 24MHz Veloce was found to be less successful than
the 16MHz, in terms of reliability. BTW, the processor offers the
option of switching between TOS 2.06 and older TOS versions, to ensure
full compatibility with older software programs!
Cheers,
EDK

Sometimes the spindle itself will stick in the bearing. This can be
cleared by the sharp twist you describe .... OR

.. with some drives you can access the lower spindle bearing through
(or under) the PCB. With power applied you can attempt to ease the
spindle by pressing with a rubber pad (eraser, rubber band etc.) and
turning. If this works apply a VERY SMALL amount of machine oil (as
much as you can pick up on the head of a pin) to the bearing. I have
managed this twice with old Seagates and they have continued working
for YEARS :-)

2003. Perl on MiNT: betatesters wanted

Newsgroup: comp.sys.atari.st
Date: 1998-07-04 00:00:00 UTC
From: Jarkko Hietaniemi <jhi@alpha.hut.fi>
Message-ID: <oeen2apvku5.fsf@alpha.hut.fi>
Source record: 97744
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Hi,

I am looking for some brave souls to try out a Perl 5.005 beta
release on MiNT.

Background: a guy called Guido Flohr did the port for an earlier Perl
release last year. I now upgraded his patches to the current Perl
5.005 beta -- but Guido isn't answering his email (maybe he is on
vacation or something) and I don't have MiNT to test the code on.

So, if any of you kind people who have MiNT and some time to spare,
could you please grab

http://www.iki.fi/jhi/perl5.004_69+mint+mpeix+mvs.tar.gz

and give it a good MiNTing.

Note that some experience in Bourne shell scripting, C programming and
debugging, and the Perl language itself may be needed to get 100%
"make test", depending on how badly I botched up Guido's work...

Having built Perl on other platforms would be also a definite plus
because then you probably don't need to read the "INSTALL" file and
you know what "running Configure" means.

From: tjendol@wxs.nl
Message-ID: <6nlg3v$1pk57@reader2.wxs.nl>
Source record: 97748

Hi,

Since my DSP broke down some time ago, I have been using Graftool as my
JPG viewer. Last week Graftool also gave up (to show .JPGs). So I
started checking Graftools logfile, and I discovered something weird:
Every 20-30 seconds the log shows a new line looking like
'MU_MESAG BABA 0007 0000 0004 0XXX 00XX 0000 0000'
where a 'X' stands for another number everytime a new message is shown.
Can anyone tell me what is going on here, what this message means?

Thanks,
Karsten

FULL DETAILS OF VELOCE+ IS NOW BEING COMPILED

****

Now we have discovered how to write and send the files to our website
we will be releasing full details in the next few days.

It is correct that the veloce 20-24 system was never released due to
instability (theirs no point in selling something unstable)

Just to set the record straight for now, the new veloce+ accelerator
is quite different than the first veloce design. It once again uses a
68020 processor but with the addition of fast ram. This fast ram is
faster than the cache systems found on most of the older accelerator
cards and hence gives a greater increase in speed.

The veloce+ system is available in 3 variations.

veloce+ (0mb fast ram) ï¿½99.00
veloce+ (2mb fast ram) ï¿½149.00
veloce+ (4mb fast ram) ï¿½189.00

Since the fast ram is 32 bits wide along with the tos system the full
use of the 68020's capabilitys is obtained (zero wait state design).
The fast ram is logged into the tos system by a small initialisation
program (auto folder of course) and is added to the ST ram giving a 6
or 8mb ram machine.

That's all for now as i am working on the web site.....

If anyone has any further questions then either send me an email
dave@tusdev.demon.co.uk or post a new message to this group

Thanks Trevor for the mail about this group

cheers for now

dave escott

Geocities may be slow, then you will get time out.
I have tested downloading the package, just on friday morning my time (
that's thursday nite in US) and the speed was OK. It downloaded completely.

Ok. guys.
We have our own views. Let's stop wasteing bandwidth here and for those who still want to discuss move over to advocacy.

In the mean time, sometimes I am still bored at work and will just do a couple more of those atari screen savers for windows. If you don't like it, don't download it, when I announce them. If you don't like Windows, don't use it (even if they are using it in church or some shops selling P**n and in all offices) but I will not curse you for using one if you have to.

2013. TAF MonSTEr Flea Market July 11th - Update

Newsgroup: comp.sys.atari.st
Date: 1998-07-04 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <359d8aa1.0@diana.idirect.com>
Source record: 97873

SATURDAY, JULY 11TH, 1998 is the date for the Toronto
Atari Federation FLEA MARKET! The doors open to the
public at 1:00 PM and will remain open until 5:00 PM.

This may be your 'last chance' to come to a bazaar of
Atari related pre-owned hardware and software where
you may find that peripheral, application or utility
for your ST/Mega/TT/Falcon 16/32-bit computer system
or your XL/XE 8-bit classic computer system.

Not only is this an opportunity to buy or sell hard- ware and software
for TAF members and other Atarians, this will also be an event whereby
you can learn what you can still do with an Atari, including the
Internet, Desktop Publishing, Scanning OCR, MIDI, and much, much, more!
There is a confirmed Internet Demo by Dan Dreibelbis (using the suite of
available Internet prgs. running under STiNG), Howard Carson of MGI will
be showing Calamus SL-98, Martin Neuland will do a demo of Logic 2.5,
and Darek Michoka of Emulators Inc. will be offering his latest version
of his GEMulator Atari emulation program for the PC .

If you have original software or hardware that you no
longer have any use for, get yourself a half-table and
try to sell it! Or find that treasure that you have
always wanted. Great deals should be in abundance.

We are anticipating a good turnout and hoping to have
some dealers at this event and thus TAF has booked a
larger hall to accomadate everyone. To help defray some
of TAF's costs of the event, the following will apply:

Half-Table's will be $5.00 or the Full-Table for $10.00
each. Half-Table's are FREE to TAF MEMBERS. Admision
is $2.00 per non-member family but if you are selling
and have taken a half-table or more, admission is inc-
luded. Admission for TAF members is, of course, Free.

The Flea Market will run from 1:00 PM to 5:00 PM, with
setup commencing for sellors after 12:00 PM, noon, and
teardown after 5:00 PM. This should allow enough time
for as many people inside and outside Toronto to attend
the event.

As usual, piracy cannot and will not be condoned. You
must be selling original pre-owned software only. If
anyone is caught selling pirated software or stolen
hardware, they will be dealt with severely!!

The TORONTO ATARI FEDERATION Flea Market will be held in the "Gold Room" of the North York Memorial Community Hall on the Lower or Concourse Level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkhome Ave. Parkhome is 5 stoplights North of Hwy 401 running East off of Yonge.

Parking garage inside the complex - enter next to the Novotel Hotel on Parkhome Ave. Those comming by public transport can take the TTC's Yonge Subway, North to the North York City Centre Station, then walk through the tunnel into the concourse, down to the food court, turn left and find the Memorial Hall on your right.

Saturday, July 11, 1998, 1pm - 5pm for the TAF "Flea Market. To contact TAF on booking a table or tables:

TAF Voice Telephone Answering Device - (416) 425-5357
Dan Dreibelbis, VP, 416-766-4743 or dreibel@idirect.com
Dave Lee, Treasurer - Sysop TAF ONLINE EMC & BBS (28.8 8-N-1) - 416-421-8999 or dave.lee@taf.ftn.org or

William - glad you get bored at work :). I do have a question, I tried downloading the screen saver from your home page and could not get the entire file to come across. Tranmission would halt somewhere between 600K and 900K, with nothing after that. Any ideas?

I will try again tonight - it may just been excessive web traffic???

Hello

I have an Atari that has not been used for about 2 years.

I am having problems getting the hard drive to go. I know the hard drive is about 20 Meg with partitions. The Hard Drive Unit was Custom built so I don't know what type it is.

I have had the Hard Drive unit working with AHDI Driver about 2 Years ago

I have AHDI/SHDRIVER v5.00 & HDX v5.00

When I boot I get the following message

ACSI Devices :
Unit 0 Identification unavailable

I have created an icon for the d drive. But I get an error saying the drive does not exist.

Any Help welcome

Regards

From: Nurmix@NO-SPAMsocal.com
Message-ID: <6nkdlu$eg0@enews2.newsguy.com>
Source record: 97878

Any thoughts on what might cause a SCSI HD to sort of freeze, with the busy light on, then about 30-60 seconds later, finish what it was doing.

I've had this happen occasionally on every HD I've ever had connected to my Falcon (14meg / stock - waiting for Nemesis upgrade). I noticed it used to happen a lot when I was using the BlowUp screen resolution enhancement software, but I haven't used that in a long time, and recently, it's started doing it more frequently. I'm thinking it's some sort of ACC/CPX/AUTO program conflict, but I haven't been able to determine that yet. It does happen a lot with CAB or Newsie, so perhaps STiNG is the culprit?

Or, is it something like a bad or too long SCSI cable (I think it's about 4 feet). I've got a Seagate 4.29gig Barracuda connected to the Falcon, and a SyQuest EZ135 chained to the Seagate.

Hmmm.........

Have you tried booting AHDI from floppy ? Shouldn't the drive letter be C
(capital C, not c which is the cartridge port) rather than D ?

Old HDs usually end their life "sticking", the heads stick to the disk
surface which cannot spin. Is your disk spinning ? Not the fan, the drive
itself ?

When this occurs, one remedy is to disassemble the unit and take out the
drive mechanism. Hold the drive in your hand horizontally, switch the drive
on, and give it a circular horizontal shake, just to unstick the head and
get it spinnig again. This works sometimes. If it does work, backup all your
data and never switch the drive off again.

Cheers,
Nick

Hmmm... Sounds like one of the first ST systems.

The older 520STs required a seperate PSU I think, which might be tricky to
find nowadays. The drives are both simble sided ones, so you'll need to
upgrade them to double sided if you plan on tranferring programs for a PC.
Maybe this machine doesn't even have TOS in ROM, so you'd need to get one.

For serious apps, you'll need a monochrome screen, such as a SM124 or SM125,
and you'll probably want a memory upgrade too.

Actually, that machine would need so much upgrading, that it might be easier
and cheaper to get your hands on a 520/1040 STE and use the other stuff with
it. Don't worry, the HD by itself is well worth the price you paid for the
whole kit.

Yes it's possible. I tried it once. However the sheer size of a few emails will probably fill up the disk after a while, especially if anyone sends him attachment.

A tip is to setup STinG on one disk, the boot disk. You'll have the AUTO files, XControl.acc, and the Dialer.acc. Not sure if this will work on a 1Mb machine though, since accessories will be taking up memory, so might need to keep them both as .PRGs. Then put newsie onto another disk. If you have a second drive, set the email data paths to that second floppy.

You'll have to struggle a bit to get it to work smoothly, but it should work.

Cheers,
Nick

```
Maybe you need the SCSI clock patch. It's a simple hardware modification for
the Falcon that resolves a few bugs with SCSI. It can be found on most FTP
sites or in the DOITF030 archive.

Cheers,
Nick

2026. Atari 520STfm system to whomever wants to pay shipping

Newsgroup: comp.sys.atari.st
Date: 1998-07-04 00:00:00 UTC
From: kclenden@iac.net
Message-ID: <359DD3ED.5D1E@iac.net>
Source record: 97886

I have an Atari 520STfm system that is about ten years old now. It's
got a double-sided drive internal, and a single-sided drive external.
It has a 2meg memory upgrade, and comes with a SuperCharger PC emulator.
It has both a monochrome and color monitor. This system comes with all
cords and power supplies, manuals, some old ST magazines, various
software and programming languages. I haven't used it in four years,
but the last time I had it on, everything worked. I'll send everything
to the first person willing to pay for shipping from Cincinnati, OH for
all of the equipment listed above. I've been meaning to find it a good
home for a while, and just now got around to it. Drop me an e-mail if
you're interested.

Not exactly: NEWSwatch puts the file in xxx\articles, where xxx is the
folder you specify in the options, and it expects xxx\mqueue for the
outgoing messages.

I don't use myself an import batch file. Here are the relevant lines in
my o.inf file, for news and mail:

```
newsdir=i:\okami\articles
mqueuedir=i:\okami\mqueue
maildir=i:\okami\mail
```

```

I�ve think your benchmark program sucks! I�ve got an STE, A MSTE and a
Falcon and normally the F030 is about 4 times as fast as the STE...
But if you turn the clock frequency of the F030 to 8mhz and turn of the
caches, it�s a bit slower than a normal STE! Coolers!

Lucky b****r!!

> I want to put it on my TT/030, so I need to know can I use the
> normal parallel port? will it plug right into my printer port
> of do I need to get the serial port?

Should be OK. Stick to the parallel port unless you have something
else claiming it.

> Do I need another cable? my normal printer cable fits on it.

Nope. Any normal cable should be fine.

> Anyone know about this printer?

I expect someone will!! Your biggest problem will be sussing-out how
to drive it. Do you have a manual? This would tell you the available
emulation mode(s). There are only really 2 modes in common use - the
HP or the Epson page printer modes. Just try 'em out :-)

Another problem which sometimes crops up with page printers is lack of
sufficient memory. They were often sold without enough memory to map a
full page in the highest res. graphics mode. You can always buy more
if necessary.

I bet you won't! Most of these jets emulate the maker's 24-pin DMPs so
there's no trouble. In many printer swaps you won't have to change
anything (except, perhaps, margins).

Hello everyone, If you're in need of schematics for your Atari stuff you should definitely visit: http://www.fortunecity.com/skyscraper/quadra/455/ You'll find schematics for a couple of computers and monitors - very handy when you have to get the things repaired... It will be updated whenever I get hold of more schematics, so bookmark and keep an eye on the site if you can't find the schematics you need for the moment - chances are that your schematics will show up eventually.

Hi everyone,
I just want to tell you about a site where you'll find schematics for your Atari stuff: http://www.fortunecity.com/skyscraper/quadra/455/
Bookmark it and keep an eye on it since the library of schematics will get additions every now and then - whenever I get my hands on new schematics and have the time for scanning and uploading them...
Enjoy!

They did a great job on the first *FEW* episodes of B5, but they went to more
powerful equipment later. Also, it was an Amiga coupled with the Video
Toaster, not just an Amiga alone.

2038. TTram expansion : how to choose the right simms ?

Newsgroup: comp.sys.atari.st
Date: 1998-07-05 00:00:00 UTC
From: dipching@ping.be
Message-ID: <359fe61699edf0@ping.be>
Source record: 97757

When I bought my second hand TT030 a few years ago I quickly expanded
the ram with the AixTT memory expansion and at this time I put two
simms of 8 Mb each ...

Today I need much more ram (using intensively graphics programs ...)
But until now I have not being able to find/buy the right simms:
Firstly a few months ago I bought one 32 Mb simm which worked
perfectly excepted when I had to write/read on the disk ... all the
files were irremediably corrupted ... at this time I tried each
possible combination with both jumpers on the card ... this didn't
work, so I put the ram back to the shop ...

A few days ago I bought two 32 Mb simms (the expansion allows up to 64
Mb ...) because I found some really cheap one ...
But, it never worked ... The ram test was only showing 7 Mb per simm
!!!!! :(

Note: of course these simms were not EDO ! Because as AixTT owners
know this is not compatible ...

Aixitt are planning to put on the market a new expansion card which
will support EDO ...

But I'm always looking for two compatible 32 Mb simms ...
Any AixTT experienced user will be welcome for help.

Thanks for any answer ...

I know the feeling. I had a few days without a hard drive and had to use
floppies. At the time I was lucky though as I was able to use a 2Mb ramdisc
as well as 1.44Mb floppies, but I was after news as well as mail.
However, if you're only after mail, it's quite possible with a 1Mb ST and
a single floppy.

A way round the attatchment problem would be to use POPWatch to check the
size of the mails, and possibly delete them if they're too big. This gets
round one of the small difficiencies that NEWSie has. It can't tell me the
size of the mail, or who sent it, until after I've got it. And sometimes
it's too late then.

> A tip is to setup STinG on one disk, the boot disk. You'll have the AUTO
> files, XControl.acc, and the Dialer.acc. Not sure if this will work on a 1Mb

> keep them both as .PRGs. Then put newsie onto another disk. If you have a
> second drive, set the email data paths to that second floppy.

If you've got 2 drives, that would work. The only problem that I can see
with using 2 discs with one drive would be with the DNS cache, as STinG
updates it with every resolve, so it would need to be on the same disc as
the programs that call the resolver.

It's quite possible to get all the required programs onto one disc. Using
pack-ice, NEWSie, QED (for editing replies), STinG and modules, the dialer
and XCONTROL, will all fit onto a 720Kb disc with ~50Kb free for any mail.
With an 820Kb disc, there's 150Kb.

There's no problem with my version of Elite (v1.02) on an STE. The only
problem there is with Elite 1 was when trying to complete mission 5, which
had a bug that prevented it. AFAIK there was another version released that
had the bug removed.

It's possible I got the first issue and just don't remember it. If I
did, it's probably stored away somewhere and I'll run across it one
of these years. :^)

Message-ID: <Pine.SOL.3.92.980705233200.14931A-100000@marvin>
Source record: 97771

For private sale in Europe: Multiple Pieces of NVDI (German)
Only Original disks including paper manuals!

NVDI is the standard system tool and software graphics speeder.
NVDI is compatible with any (MEGA) ST(E), TT, Falcon, TOS,
MagiC ATARI, MagiC PC, PaCifiST and many others.
It supports Speedo(r) and TrueType fonts (Type 1 optionally) and has
drivers for many b/w and color bubblejet, pin and laser printers. It
handles halftone and true color printing.

a) NVDI 3.0
the standard, speed and fonts for any ATARI,
usable with only 1 MB of RAM (or more),
including eight Speedo(r) fonts

for only DM 25 (or equivalent in any EC currency or US$)
^^^^^

b) NVDI 4.11
speed and font capabilities as in version 3.0 plus:
very broad printer support, perfect support for MagiC
(Fastprint), font install without reboot, Unicode(tm) support,
NOVA-VDI support, including eight new vector fonts, control panel
server COPS and much more. (2MB of RAM recommended)

for only DM 35 (or equivalent in any EC currency or US$)
^^^^^

c) NVDI 4.11 MatGraph
same as NVDI 4.11 plus:
ADDITIONAL special support for Matrix MatGraph graphic cards

for only DM 40 (or equivalent in any EC currency or US$)
^^^^^

(Costs for package and shipping from Germany are additional...)

Huh! Same as my set up except that I don't have ET4000 :-((

I wonder what is going wrong. What about the Magic Config. settings?
Have you got TOS Compatibility = OFF?

Do you only get these effect with Jinnee? What about trying Magxdesk?
It sounds like some confusion in the AES but there's not a lot you can
do to alter this. Or try plain single-tasking TOS just to get a clue
where things might be going funny.

Hum... I only have v5.11 and it's in the /EXTRAS folder on the release
disks. If you don't have this I guess it may have been consolidated
into the kernel.

As usual with Magic there are NO docs. saying what it does or when it
is necessary. I think I remember that you need XMEN_MGR if you want to
use pop-up menus.

You only have to select a directory for the destination. Okami will
take the filename from the uuencoded message.

>Hmmm...they are written as long filenames to disk. I would think that Okami
>would be able find them as such.

It's not Okami that does the searching on your disk.

I've compiled this code under UNIX and ran the resulting programs, and
I can find nothing wrong with them. Both directories and files with
long names are created and found. But let's make sure the bug isn't
somewhere in Okami.

Import a newsgroup with long (sub)names and make sure the names of the
directories and the files exactly match the portions between dots. So
if you have newsgroup rec.bicycle-crazy.bicycle-fanatics, you should
get a file ../news/rec/bicycle-crazy/bicycle-fanatics.idx (plus
others). Now run o.prg with log level 99. Try to open the group. You
fail. Quit the program and look in the log file. If Okami reports that
file ../news/rec/bicycle-crazy/bicycle-fanatics.idx cannot be found,
it is the OS that is (somehow) at fault. If, however, the filename
(including the directory names) doesn't *exactly* match the names on
your disk (upper/lower case is probably also distinctive), then the
fault is Okami's.

Hi Carsten,

surprises me.... I called Wilfried early this year and all he told me
was there was a NVDI version for the TC1208/E... not for the others.
Must have been a one-off version then you're having, or he didn't support
the older version any longer... He explicitly told me "Only for the 1208".

Glad I got it, the NVDI drivers are much better than any Matrix version I
tried (couldn't get That's Write running, Freedom showed weird things, ST-
Guide crashing on some hyps - that's all perfect with NVDI driving the card).

Not to mention the special and personal service I got from Wilfried, it took
several hour-long calls to get the stuff up and running because of a bloody
old Newdesk.inf plus a minor fault on disk-2... But I surely recommend NVDI
for Matrixcards if the type is supported.

Hi Hallvard,

what your ISP says is (if I'm getting this right): packets are received.
What does the tools say? Packets being returned??? You can see that easily,
they're coming back with a small delay. If not, your set up is stinking.

Hi Martin-Eric,

only second hand... unless an old dealer has some lying around in the dust.
I know they're sparse and what I also know is I never let mine out again :-)
(Well, unless some idiot pays me the then-new-price, nearly USD 1500,-)

You get across them sometimes in Germany, TC1208's for around 500-800 DM.

Dunno about the older types, but why the heck buy a card for only 8 or 15/16
bit nowadays? I'd say: go the full road.

Well, the problem I had on my STE was minimal compared to the trouble
you've had, so the clock patch may be the answer in your case, I
guess. Why the resolution should affect the problem beats me, unless
it's to do with processor loading or something similar.

Sorry I can't be more help.

Source record: 97708

Hi all,

Has anyone out there managed to get STinG to work under MagiC-PC?

I can get it to dial and connect OK, and can ping and resolve, but
both CAB and POPwatch lock up after a couple of seconds and no more
data transfer takes place with those clients.

At the moment I've just copied over my setup from my STE as it worked
fine there, and most of the settings are the defaults as supplied
with the program.

Any ideas, anybody?

TIA

Hej Hallvard,

hehe, I recalled having fetched Papillon 2.5 demo from ASH's site some time
ago, went to look into it's archive and found Papillon.fnt...
So I added it to Assign.sys and threw it into my Gemsys and guess what:
fVDI bombed out on it. Didn't even bother to start up NVDI with it, the font
must be corrupt, and that much corrupt that it crashes the replacement VDI...

Better wait for a working version then... BTW: did the font on your
brother's set??? Would beat me...

You probably won't need even 1 copy of this useless thing :-)

The following is For Sale (Long Live Atari!):

$450 or B.O. for the following:

Cash & Pick Up only at this time. I live in the Chicago, IL area.

Atari TT with internal HD (40 Meg, I think). It comes with the PTC1426
color monitor and 8 Megs of ram (4 ST, 4 TT) and an external hard drive
which I believe is 400 Meg. I will also have a 24-pin dot matrix
Toshiba
printer for sale with many extra ribbons and a sheet feeder. TT comes
with
loads of ST and TT software. I also have a Migraph Hand scanner which
can be used with an ST or TT.

Chuck

Ahh... xmen_mgr.prg did the trick for aFTP, Roger. But not for Imagecopy.
I originally stated that booting with wdialog prevented IC from crashing
when accessing some of its menus. Well, when I first tried this, IC
didn't crash... but the crashes are still occuring, so somehow I fluked
out when I booted with wdialog. Just thought I would clear this up, as
there's enough misinformation about wdialog without me creating more ;-)

Yes, that line is commented out. A question about your last statement, having heard this before: Should the CPX be saved with preemptive multitasking 'off', or is it safe to have the CPX saved with it 'on'? In other words, should it be turned on from the desktop just after booting? I've tried both ways and MagiC runs fine (except Imagecopy). Perhaps a minor detail but I needed to ask.

> Also, make sure you're using MAGTOROM.PRG in your AUTO folder, along
> with MAGXBO32.PRG. That will protect your MagiC kernal in memory.

I tried magxbo32.prg in the auto folder but Imagecopy still crashes. I couldn't find the file magtorom.prg anywhere, though. Here's what was in the 'extras' folder:

```
C:\GEMSYS\MAGIC\UTILITY\EXTRAS\
<AES_LUPE > 0 5Jul98 08:27:58
<BIN > 0 5Jul98 08:28:06
<CLOCK > 0 5Jul98 08:28:04
<COPS > 0 5Jul98 08:27:58
<FLOCK_OK > 0 5Jul98 08:28:06
ADDMEM.PRG 200 18Jan90 20:08:56
HARDCOPY.PRG 2829 10Sep94 15:02:02
MAGX.INF 9498 26Feb97 01:11:10
MAGXBO32.PRG 1052 22Jun96 19:49:08
ROMDRVR.PRG 972 2Jul93 22:55:38
XMEN_MGR.PRG 13532 3Nov96 16:44:36
```

Any chance you mean romdrvr.prg? Experiments are off until I know what I'm booting ;-)

Right. But some day Andreas put it into the kernel but I doni¿½t remember
when. I think it was 5.20.

Easy test: Download SMU (Start me up) from Thomas Muchi¿½s web page. If it
runs without XMEN_MGR, it is included in the kernel. If not you know
that you have got to install it :-)

The clue is in the name, I think. Something like eXtended MENu
ManaGeR. AFAIK it adds to the MagiC AES cascading and pop-up menus so
you need it for any program that uses either. Must admit I can't see
why this doesn't default to being installed if they insist on having
it as a separate program.

I did this and the exact name is created, but not found. And yes,
the log reports the correct filename.

If it's MagiC's fault, I can only guess that for some reason it's
only looking at the 8+3 equivalents when getting that call.

My Falcon died on me yesterday, so I'm having to use my STe, at least for now. I didn't have a copy of the med res Semper resource in my Semper directory, because I never needed it. I did have a copy of my complete Semper archive, but much to my chagrin, it was corrupted, so I'm unable to extract the resource.

Can someone please send me the med res resource for Semper 0.80b? Or if you don't have 0.80b, the complete 0.79b archive would also suffice. I'm kind of stuck now, unable to get online to do my Fido-type networking.

Thanks.

From: outrider@lvdi.net
Message-ID: <35a0e5f63fc0af2@lvdi.net>
Source record: 97718

With the way POPwatch works, my passwd file is currently at about 12 addresses (and growing), even though I only have one real email address. (I sure wish Gary would provide a fix for that.)

Whenever I import one of these mailes with the weird addresses and then reply to it, Okami uses the weird address in the From: field. So if a mail comes in addressed to postmaster, for example, a postmast.txt file is created, my outgoing reply is from postmast@lvdi.net, which is invalid.

Maybe my mail makes it to the destination with that incorrect From: and maybe it doesn't (I'm not sure), but it's certainly a problem with mailing lists, because you're signed up with your correct address. Therefore, unless I edit my outgoing mail, it doesn't work.

Do I have something set up wrong? Is there a way to force my correct email address when replying to these emails?

You can save it on. The idea is to make sure preemptive multitasking
is not on during the AUTO boot process.

>I tried magxbo32.prg in the auto folder but Imagecopy still crashes.

Actually, you shouldn't need it for Imagecopy, but it's a good idea
to use it, anyway.

>I couldn't find the file magtorom.prg anywhere, though.

Hmmm...I thought that came with MagiC. Are you sure you looked
everywhere?

> ADDMEM.PRG 200 18Jan90 20:08:56

It's a good idea to add this to your AUTO folder, though you'll get a
message when you need it, so that wouldn't help your Imagecopy
problem. Still, even though it warns you that you need it, it shuts
down your system and disk corruption is possible. (I just *now* had
that problem on my STe, because I wasn't sure if it was an 030 only
program. Clearly it's not. <sigh>)

>Any chance you mean romdrvr.prg?

No. Not that I know what that program does (you're right about the
MagiC docs).

Maybe I got it off of Uwe's page. I think he wrote it (MAGTOROM,
that is).

I'll keep thinking on Imagecopy, but I don't remember doing anything
special to get it to work with MagiC. BTW, I have TOS Compatibility
switched OFF in the MagiC CPX.

>only looking at the 8+3 equivalents when getting that call.

To follow up on this, I think I know why Okami is not working with MagiC's VFAT LFNs, though I don't know how to fix it.

I said before that when decoding files, Okami gives me MagiC's 8+ file selector, even though I'm in a VFAT partition. Well, that tells me that MagiC doesn't know that Okami is LFN-compatible, because if it did, it would give me the LFN selector. For instance, when using QED, I get the LFN selector. However, when using, say, STeno, I'll get the 8+3 selector.

So there is some type of auto-detection going on that MagiC uses to determine whether the calling program needs the 8+3 file selector or if it can handle LFNs. However it works, clearly MagiC thinks Okami needs the 8+3 file selector, so it would follow that when Okami's looking for LFNs, MagiC is only looking at their 8+3 equivalents.

So the question is, how to make Okami tell MagiC that it can handle LFNs? I don't know the answer, but I would think it would be something real simple, like a system variable or something.

Anyone?

I am looking to sell my Atari 1040STf Computer, Atari SC1224 Color Monitor, and misc. software for the Atari 1040STf. Everything is in excellent condition and I have the original boxes and manuals for the computer and monitor and some boxes/manuals for the software. I am willing to consider any reasonable offers at this time. Thank you for your time.

Good idea.

But regarding hit counters, GeoCities does provide free counters.
The problem is, they don't work, at least in CAB. Every GeoCities
site I've been to (mine included) always shows a count of 0000. And
contacting them by email is problematic at best, since their email
address (except for sales) seems to be a carefully guarded secret.

>Just my thoughts, I'm tired of waiting those extra minutes so that
>Yahoo, or excite can decompress those little banner ads. A 32x32
>pixel ad does not have to be in true color.

Except the vast majority of banners are GIFs. That's the only way they can be animated. Also, a properly configured advertising filter (which, admittedly is not an easy thing to do, since ASH decided we don't need docs for it), you can bypass a great many of them.

Personally, I'm thankful for the JPEG graphics on the web. Not only do they look better, but they're smaller. Yes, they take a little while to load, but I don't blame that on the web or Microsoft or anyone else. I'm using old technology. Why should the web appeal only to the lowest common denominator? Things will never progress with that attitude.

Hey, if graphics aren't your thing, use text mode.

Why
>buy something worst, heh? Obviously, they want to copy it.

AFAIK Alpha processors are manufactured by Digital which is now owned by Compaq and they're the one who own the technology. Judging from your conversation Intel have bought or licenced Alpha technology, is this true? If that's the case, where can I find more information about this since I have obviously missed something.

But this copy part is ridiculous, Intel needs the latest in technology just because of their efforts to keep the old structure and concept they used in the Intel x86 processors. A concept dating back more than Intel CPU's and that was great ... back in the 80's in the first Z80 home computers. Today Alpha and PowerPC processors are way ahead if you compare the ratio between technology used and performance given. Intel has often used better technology if you look at plain electronics involved. Still they get outperformed by relatively simple and cheap RISC processors.

(I apologize for wasting bandwidth for all the members of this newsgroup that aren't intrested in this so called debate)

ethhoack wrote in message ...

>1. the saveguard of the atari spirit against its inner and outer
>enemies.

Quit doing it by having this dramatical simplistic view suitable for a child. You make everything sound as if the computer market and industry is some kind of idealistic almost elitistic mass of people trying to conquer the world and get to world domination. Everyone tries to get their share of the market, Atari failed in doing the exact same thing that Microsoft now succeeds with; selling their products. We don't have to like Microsoft, very few appreciated Atari back then.

>2. the fall of microsoft who's bloating domination outbreathes the
>whole computing industry.

Sadly that's what I also come to think of when I follow Microsoft's actions and developement, but I know that everything's a lot more easy. Microsoft wants to earn money. Everybody else on the market is also intrested in earning money. We can't say Microsoft is "wrong" any more than we can say Atari is "right", it's a question of success and failure. Where would you judge Atari stands today?

Neither I like Microsoft's way of doing things, not at all. Yet I realise Microsoft set the standards for home computing of today. Still I and many others love Atari. You can't argue forever about things that simply is no matter of opinion but of facts.

>incidently the fulfilling of the first objective has no way before the
>second is accomplished.

You cannot and will not change the world by complaining about it. Instead help make Atari usable for others than us. Promote Atari and develop for the Atari platform. People will stop using products from Microsoft only when they are able to choose something equally or more usable and affordable on the market. They want to get work done, not give all they money to Microsoft, thrust me.

Your first objective is accomplished by getting along with people that also want to give Atari a go. The second by giving people a product that gives them a possibility to choose.

>for those of you non-hypocritally are atarians, the only way to take
>part in the 1st objective is to totally reject m$ where the computer

>belongs to you.

You cannot reject the industry standards in that meaning, you might not like them but you might have to use them to get anywhere ....

>for those of you too coward to face the truth and giving away their
>arm or leg to m$ and have no other way than insulting me (coz actually
>i've been the only one really insulted so far in this debate), shut
>the hell up, collaboration is treatory.

To quote you: DUH!!

To debate in the manner you do, one must expect to get insulted. Judging from that you probably speak of other things in the same way, you're probably quite used to getting insulted too. The reasons for you getting insulted and the reasons you might had to insult the developer of a screensaver differs somewhat. You are being rude, he's being creative plus the fact that he shows he likes Atari.

If I were you and had said what you have said so far, I would try to explain any good intentions I might have in a more mature way and apologize at least for without acceptable reason insulting William Wong.

From: ben@imperial.co.uk
Message-ID: <6npqf9$b9c$1@nnrp1.dejanews.com>
Source record: 97780

Hi All,

Yesterday I managed to accidently select the Recover Partition Data option from the HD Driver v6 Hard Disk menu. This has now messed up the partition information on my Hades and now when it boots I get an Illegal Instruction error message and a lot of HEX numbers. I have been trying to boot from floppy disk by holding down the Alt key at boot up as this works on a Falcon.

I am really stuck as I cannot boot to the desktop and therefore I cannot re-partition my Hard Disk (IDE) to be able to perform a restore.

As the Hades is a TT clone does anybody know how to boot a TT/Hades from floppy?

Any help would be greatly appreciated as I cannot use my Hades until I have fixed this problem.

Please could you send any replies to me via Email - ben@imperial.co.uk

Thanks,

Regards,

Ben Hills.

Hi

I was an atari 1040 STf owner, I sold it in 1989 but never
bought a STe.
I still have got lots of disks that I don't use, so I want to
get the same pleasure on my today's computer (for more than 3 years :
an Acorn Risc PC) and make a clone of Archipelagos.
Could anyone explain me the rules of the game, as I don't remember these
(it's too far away in my memory)?
It would be nice to also send me some snapshots to reproduce the gfx (and, in
particular, the island generation)?

Thanks for any help.
Stan.

>Anyone know of a source for a good, free web hit counter?

Ask your ISP if they keep a library of CGI
programs for your use, such as the
WWW HOMEPAGE ACCESS COUNTER AND CLOCK,
<http://www.fccc.edu/users/muquit/index.html>
programmed by Muhammad A. Muquit

If your ISP doesn't, you might gently suggest
they implement a standard CGI library, especially
if individual accounts aren't granted CGI access
for custom scripts.

You'll find these counters on each of my web pages
(hint: they're hidden! Use "View", "Source" on
your browser to find the code), as well on the
main statistics page located at:
<http://www.tmisnet.com/~strads/stats/index.html>.
PLEASE NOTE: My stats page was not intended for
public view -- I'm mentioning it only to answer any
questions like "What good is a hidden page counter?"

A bonus technique on the stats page: click on the
counter of the page you are interested in seeing,
and it will be loaded. This is a handy trick if
you're developing a stats-like page for someone else!

Following for sale or trade: (Prices Negotiable)

NOTE: WILL TRADE ANY OF THE ITEMS ON THIS LIST FOR PC EQUIPMENT-Hardware and/or Software.

Hardware-

ALL hardware is in good to excellent 'used' condition and pre-tested before shipping.

1040STf's-(still going strong!)1meg-used/tested.....$50ea.
Includes Atari Mouse or Marconi/Marcus 3 button track ball, your choice.

Atari SC1435's -14" stereo RGB monitor, headphone-jack, video cable, used/tested...$65ea.

Atari SC1224 12" Color Monitor - used/tested..$40.

Atari System: 1040STf + SC1435 + Atari Mouse or Marconi Track Ball-all items used/tested.......$100.

Atari PCM124 12" Monitors-New-$20 ea. Original box and manual.
Believe these were used on 286 type computers and Atari's short lived PC. Two units available. 7-Pin video cable.

LYNX STUFF:

LYNX Kit Case-Carry Case-NEW
12"wide 9 1/4" tall 4 1/4" deep-$15

Comlynx Multiplayer cable-new-$5
LYNX AC Adapter-120V 60Hz-$10

More LYNX STUFF to follow....

ST Software: all games are in the box with manuals

Hardball-Accolade-baseball sim-$5
ST Pool-Shelbourne-rack 'em up-$5
Map & Legends-The Cartographer + Data Mao Collection- $10
Gold Rush-Sierra-adventure sim-$5
Flight Simulator II-Sublogic-with Scenery Disk #7-$10
RISK-Virgin-Word conquest game-$5
Their Finest Hour-Lucus Films-The Battle Of Britain-air combat sim-$5
SCRABBLE-Leisure Genius-crossword game-$5
EZ Test Writer-$5
DragonScape-adventure game-$5
Metro Cross-Epyx-scrolling skateboard game-$5
Data Diet-Disk compression program-$5

StarGlider-Firebird-3D combat-air to air/air to ground sim-$5
Final Assault-EPYX-mountain climbing adventure-$5
Transputor-cool 3D marble action game-$5
LED Storm-Road race with lazers-$5
Crash Garrett-1938 adventure game in FRENCH-$5
Karateka-Broderbund-realistic karate fighting-$5
Championship Wrestling-Epyx-Wrestling Mania for the ST-$5
Phantasm-space shoot-em up-$5
Project Neptune-Epyx-James Bond type adventure-$5
Renegade-Taito-street fighting-cool game-$5
Prime Time-make your own TV shows-$5
Battleship-EPYX-boardgame for the ST-all aboard!-$5

Following-no box OR doc's

Warship-Stratigic Simulatons-$2
Read & Rhyme-Unicorn-$2
Math Wizard-Unicorn-$2
The American Pastime Baseball Simulator v3.01-$2

That's All For Now.....
Buyer pays Shipping.
Payment: Check/M.O. or COD, your choice.
Ship from New York
Dan Fangmann
Ship to USA & Canada ONLY!

I would think that the Alphas only did the rendering, so it shouldn't be to hard to port a
renderer to it. The editing probably took place one something else.

Please ignore this person. He has already made a fool of himself on the
french newsgroup, using references to satanism and nazism, which are
absolutely unforgivable in my point of view.

Comparing Microsoft to Hitler is extremely offensive to all the victims
of the second world war.

Methinks he is just a stupid kid trying to attract attention by spewing
out totalitarian trash.

William, please don't pay attention and keep up the good work.

Cheers,
Nick

2118. MagiC's AES

Newsgroup: comp.sys.atari.st
Date: 1998-07-06 00:00:00 UTC
From: Neil Roughley <roughley@HORMEL.unix.dsoe.com>
Message-ID: <FN_35a01742_roughley@news.dsoe.com>
Source record: 97794

I've finally installed MagiC 5.11 on my TT. When I access any of
Imagecopy 4's hierarchical submenus a crash occurs:

Program returned :
68000 Exception
Error #-69

Another victim of MagiC is aFTP, whose 'Connect to' submenu is nowhere to
be found, yet under Geneva it's there.

Are the examples above simply 'casualties' of MagiC or have I missed
something?

Stop being a nuisance.

You have absolutely no clue how newsgroups work and how to behave in
public. Nobody here appreciates your posts or agrees with your
extremistic and unrealistic views.

Why don't you go to comp.sys.ibm.pc.advocacy ?

Nick

>
> TTFN
> John

hi john,
i agree in your opinion that this problem isnï¿½t caused by STing, because
i donï¿½t use it at all. i nearly became mad with this SCSI-problem on my
F030. at least, i decided to by me an IDE-HD - sad but true.

the story: when i but my F030 second hand, it included an 100MB-SCSI-HD
that worked fine. so i decided to add an quantum fieball 1.2GB-SCSI, and
at first there where no problems (i used HDDRIVER6.x). then, after about
a year, soon this strange effect with the "hanging"-SCSI-HDï¿½s appeared.
i changed the flat-cable, checked the termination and the connectors,
but the problem was still there. i found out that the "new" fireball
drive had a lot of bad sectors, and the drive seemed not to be able to
handle them right. i suppose i have caused a head-crash during my
diverse "hardware-installations" (better turn off your computer before
demounting a harddrive ;-)!!!). but the older SCSI-drive was still
okay. so i put out the damaged fireball, but that was no use - the
problem didnï¿½t disappear.

itï¿½a mystery to me - i donï¿½t know what to do. iï¿½ll try the clockpatch in
the near future (needs some free time, which is rare these days ;-)).

the only thing i found out: it is resolution-dependent. in
2-colour-resolution sometimes it works better, but not in any case.
any good ideas about this ?

greets -micha-

Hi,

Is there anyone out here who has experience with ANS (Atari Network Service). I connected my two MegaST computers, both equiped with a Riebl card, and installed ANS. I use the MegaST4 as the network server. The MegaST2 is the network client. I managed to mount a dir from the MegaST4 on the MegaST2. But after other dirs to mount nothing worked anymore. It is also impossible to login on this machine with any username.
Can somone give me some advice?

Message-ID: <WS.35a0a6ca.0007598e.ethh@enemy.org>
Source record: 97804

i do pursue 2 objectives:

1. the saveguard of the atari spirit against its inner and outer enemies.

2. the fall of microsoft who's bloating domination outbreathes the whole computing industry.

incidently the fulfilling of the first objective has no way before the second is accomplished.

for those of you non-hypocritally are atarians, the only way to take part in the 1st objective is to totally reject m$ where the computer belongs to you.

for those of you too coward to face the truth and giving away their arm or leg to m$ and have no other way than insulting me (coz actually i've been the only one really insulted so far in this debate), shut the hell up, collaboration is treatory.

Transmission errors of single data packets are counted, but don't ask me
for details.

> normally indicating a very fast connection. However, the send light
> is almost as active, with my actual received data (according to the
> CAB display) slowing to a crawl or even stopping altogether. At
> times it almost looks like the two sides are fighting. ;^)

When the connection is rotten, the received/sent data packets come with
CRC-errors. The modems or ISDN-adaptors exchange information about it. If
a packet is identified to be defective, its transmission is repeated.
So, a dialogue between the two sides is necessary.

Regards,

Kerstin

Lattice is only a C compiler (and claims to be runnable from floppy -
wouldn't recommend it though). As far as I know, the only C++ compiler
for the ST and Falcon is G++ (the free GNU compiler).

I just tried booting with wdialog 2.0: Imagecopy's submenus work now but
aFTP's don't. Hmmm... why does aFTP and wdialog work for you (perhaps
because of a different version of MagiC)? I tried the latest aFTP, too.
Any clues, Sti¿½phane?

Hi Carsten,

don't forget to mention that NVDI-Matgraph ONLY works with the TC1208 and
TC1208E... not with the 1000 series or older cards.
I bought 4.12 last February, it's for the 1208/E series only!
Checked this with a friend who owns a 1006 or 1008, DID NOT WORK!

It's GREAT with a 1208, though...

Lattice only makes C compilers, not C++ compilers, I think.
The only C++ compiler on atari is gnu C++ (free), as far as I know - v 2.8.1 I think. You'd better have an harddisk...

Re: Rich Tietjens...

There has recently been considerable converstation here about Rich Tietjens, and I think this may be the appropriate time for the Portland Atari Club to make an official statement on this issue.

The account "Atari@teleport.com" belonged to the Portland Atari Club, not Rich Tietjens. It was donated by Teleport to the club. After his sudden resignation from the club, he refused to relinquish control of that account over to the club, and abused it to the point that it was cancelled for "massive spamming", which severely damaged the reputation of the club, even though the club had absolutely nothing to do with it.

Although he continued to claim that he was associated with the club for some time, he was not, and he was never acting for the club when he scammed people out of their money for magazine subscriptions etc.

Rich Tietjens has refused to return the club's computer equipment to our Vice President's house, like he has been asked numerous times to do, and likewise he has refused to return the equipment/money of others.

It is the opinion of some, that you are his best friend if he thinks you have money he can get, and as soon as he gets it, you are non-existant until you have more money he can scam away from you.

Rich Tietjens has personally tried to smear the good name of the Portland Atari Club, it's members, and anyone who disagree's with his continual abuse of the internet, the Atari community, and the general public as well. Regardless of his claims to be an "anti-spammer" the facts show that he is a spammer, an internet abuser, a scammer, a thief, and a liar.

The actions of Rich Tietjens are not approved by, nor paticipated in by the Portland Atari Club in any means what-so-ever. He does not represent the Portland Atari Club, and has not even been a member in quite some time. He resigned and disappeared like a thief in the night.

While there is certainly no acceptable excuse or explanation for the Rich Tietjens' of this world, I would like to apologize for the club to anyone who has been ripped off by this individual, (Something I have been doing a lot of...), and reassure everyone that none of these types of shady dealings, and shenanigans will take place as long as I am the President of PAC. I would also like to thank everyone who has stepped forward and offered to right the wrongs caused by Rich Tietjens, since the club is currently unable to help out thanks to the financial ruin he left it in.

The Portland Atari Club can now be found at:
http://Portland-Atari-Club.cc

We don't currently have a file area available, but we do have a main page, and a links page, which everyone is encouraged to add your Atari Links to. It is all automatic, so go and add your links. I would like it to be the biggest, and most accurate list of Atari Links on the net. In the near future, I am also hoping to add a message board for the Atari Community, and if everyone wants it, I will also look into getting all of those files back on-line. In the meantime, feel free to drop me an E-Mail with your file requests, and I will do my best to get them to you as long as they aren't of the pirated variety. (Sorry, PAC doesn't support piracy either!)

The Shadow (David Hunt)
President, Portland Atari Club

As an Atari user, I don't see any attacks. Microsoft doesn't even know we exist, so I don't see why they would attack us.

On this group, I don't see "inner or outer enemies". I see people who use different computers, in different environments, and who happen to have an interest in Ataris.

If you are so paranoid that you see enemies everywhere, then you need help. You know, medical help.

>
> 2. the fall of microsoft who's bloating domination outbreathes the
> whole computing industry.
>

Then take all your drivel to the places where people discuss Microsoft products. Tell THEM that they're wrong, not us, who happen to use an Atari, even if we also sometimes use a PC.

You are aiming the wrong target here. And you are on the wrong newsgroup. Take it to the advocacy groups. This group is no place for attacks and flames. Followups directed to comp.sys.atari.advocacy.

> incidently the fulfilling of the first objective has no way before the

You started the insults, you get insulted. That's how the world goes.
You haven't done one single productive thing on this newsgroup, or for
the Atari community in general, and you started flaming William, who has
already written several programs.

Hey, don't you think there are more important causes to crusade for ?
You know, things like human rights, Tibet, China, Bosnia, aids, cancer,
whatever...

Get a life.

NOOOOOO!

Excuse my unprecise offer:

It should read like this:

NVDI 4.11 Matgraph CXX
======================

It probably works ONLY with the 256 color Matrix Matgraph cards (eg
Matgraph C110ZV, as mine) AND NOT with any TC card!

Sorry, and thanks for the hint,
Carsten

Oh :-(I think you have missed something, Neil, as aFTP works fine
on my TT+Magic. Can't speak for Imagecopy as I only have v3 (which
works OK, however). I wonder whether you need XMEN_MGR.PRG in /START.

I have just checked and I have also XMEN_MGR.PRG in the GEMSYS\MAGIC\START
folder.

aFTP version is 1.4b2, Magic is 5.13, Jinnee is 1.01, NVDI is ET4000 4.11r7,
Wdialog is 2.0G taken from Thomas Much's site

you arrive on an island. the souls of the ancients are petrified. you must destroy the alien obelisk to beat the island. to do this you must first free all the souls of the ancients from the stones by destroying these stones. you can only destroy a stone that has a ground connection to the obelisk. creating land consumes energy. eating plants give energy, and releasing a soul give more energy. meanwhile there are tree growing up and down and infecting the land with the blood of the ancients; cleaning the land consumes energy. there are eggs that launch the blood rain on an island. there are beasts eating the island around to the center. there are lost souls with bounce of the edges of the islans in your direction. sometimes you must build huge bridge thru the sea to build connection and use them before they get eaten, etc.

upto level 200 every 5 levels, the map was a funny drawing upon which you play the level.

island generations were most of the time fractal-like.

>
> I'd love a DEC Alpha machine -- all I need is to see NT have better game support, along with hardware support for > Voodoo2. Maybe a Matrox MGA-G200? :>

They used Photorealistic RenderMan from Pixar. This is a quite
expensive aplication, only used for rendering. The RIB data
(RenderMan Interface Bytestream) was generated by an
export function of 3D-Software Softimage.

A even better renderer is freely available for Linux, the Blue
Moon Rendering Tools (BMRT) of Larry Gritz. This software is a
combination of a raytracing and radiosity renderer.

As 3D modeling tools you can use Amapi 2.11, SCED, Leo3D or
AC3D. For correctly moving physical bodies you could use
Xaero.

And ofcourse you have good old POV ray, whici can be a very
fast renderer when you are yousing a Beowulf configuration.

I am quite sure this list wasn't complete.
So there are some 3D tools available for Linux.

(No I am not a 3D software specialist. I am just a reader
of the excelent German magazin C't (Computer Technik), they
have a very good coverage of Linux items.)

Hans

Please provide evidence and names of people in this forum who are trying
to get you away from your Atari. I haven't seen anyone threatening you
of coming over and beating you up if you don't start using Windows.

As I said (and as you appropriately snipped out), if you beleive that,
then you are completely paranoid.

>
> outer enemies: microsoft, microsoft and microsoft.
>

Maybe microsoft is an enemy (certainly not nazism or satanism, please
stop referring to things that you don't understand), but it's the
standard. Whether you like it or not. I'm certainly not fond of Windows,
but I use it because I have to. Now, I don't see what grief this causes
you. Is my PC interfering with your karma or something ?

No you don't.

In the past 3 months, you have never posted to anything else than atari groups, be.politics where you seem to be quite annoying too, and alt.destroy.microsoft where you should probably be right now.

Why don't you go and convert all the "sinners" on microsoft.public.excel.misc or comp.os.ms-windows.apps if you're so brave ?

> >Hey, don't you think there are more important causes to crusade for ?
>
> nothing is more important than freedom where we live. and long-term
> freedom under microsoft is already and will get more unacceptable.
>

What about the freedom to use whatever computer fulfills your needs ? Nobody is forcing YOU to use Windows, so why bother other people.

I told you there are more important causes in life to get angry about than the OS you're computer runs. Go and tell the tibetains that they shouldn't use Windows95.

Here goes another one in the killfile... Oh, and if you really want to followup on this post, please do so on ALL points, not just the ones you want, and take it to comp.sys.atari.advocacy where this sort of childish thread belongs. This is the second time I tell you this.

Nick

well thanks for the idea. i'm gonna storm some sinners newsgroups.

but not before the atari ones are m$-free.

>What about the freedom to use whatever computer fulfills your needs ?
>Nobody is forcing YOU to use Windows, so why bother other people.

because everywhere i go i'm forced to use windoze. microsoft is
forcing pc retailers to sell windoze. so useing windoze is supporting
the monopoly and forcing others to use windoze.

>I told you there are more important causes in life to get angry about
>than the OS you're computer runs. Go and tell the tibetains that they
>shouldn't use Windows95.

of course they shouldn't. nothing good can come out of using microsoft
produkts.

Both of those programs work fine here under MagiC 5.11, on both a
Falcon and an STe.

Make sure you have the #_TSL line in MAGX.INF commented out or
removed and turn on preemptive multitasking from the CPX.

Also, make sure you're using MAGTOROM.PRG in your AUTO folder, along
with MAGXBO32.PRG. That will protect your MagiC kernal in memory.

Well everyone,

I have written several letters to Mike Goodman over the last 4
months, and he has not been decent enough to reply to any one of
them. I can only assume that he wants no more to do with the Atari community.

I might also add that he has stollen over £250 worth of software
from myself,that I have been asking for the return of since last
November,and now have to resort to legal action. Be warned and dont
send him any money or anything valuable!!!!!!

Dont get me wrong,I liked the bloke,but I cant stand ignorance,or theft.

Seeya on t'other side,
Keith.

Yeah, aFTP works fine for me in this area. The only thing I haven't
been able to do is create a directory, but that might be a GeoCities
limitation rather than an aFTP problem.

The easiest way would probably be to set up STinG for your PPP
connection, and then use POPwatch for mail and NEWSwatch for news
(both "watch" programs are very easy to set up). This combo works
very well with Okami.

The only problem with this theory is Stoop will not run under MagiC,
so it /has/ to be placed before MAGXBO32 and MAGTOROM. Which is
actually the way I like it, because it allows me to easily select a
TOS set up.

That's fine, if you have the time, energy and space to do that. I have the space, but neither the time and energy. Just as I didn't worry about 40 column users on my BBS, I'm not going to create separate web pages, just because someone is using old technology and doesn't want to wait for my graphics to load. (Of course, I don't plan to use a million graphics, like some sites, either.) If that turns off some prospective visitors, so be it. I'd rather devote my time to making my site as good as it can look to most people, rather than spending a bunch of time creating a dumbed down version.

>The problem is that web pages are so simple to make that every man and
>his dog just throws a load of nice pictures in and thinks its great..
>If they took the time to do the job properly then an ATARI machine
>arriving would get an appropriate page for that browser..

Well, I'm grateful that most web sites don't dumb down for me. I'm using an Atari browser, and I WANT to see the great graphics. I normally use a 768x480xHC screen, so why not? The only time I'd want to see the site dumbed down is when javascript is involved. Thanks, but no thanks on the GIF graphics instead of JPEG graphics.

Source record: 97598

On Tue 07-07-98 09:56, Pascal Ricard scribbled:

>You have to put it 2 (folder) levels under POPwatch, or at the root of
>the partition if there isn't enough levels (as I did).

I created an alias file, but it's not working, for some reason. I
have POPwatch in D:\POPwatch\. So I put "alias" (that /is/ the
filename, isn't it?) in my root directory. That didn't work, so I
copied it to my POPwatch directory. That didn't work either.

Here is my alias file:

braves outrider
chopchat outrider
cyberchop outrider
chiefs outrider
"chiefs outrider
"'chiefs outrider
magic_os outrider
mike outrider
postmaster outrider
sportingnews-kindred-list outrider
sportingnews-wigge-list outrider
world_report outrider

I've gotten in mail from several of these addresses, including
magic_os (which was also in your example) but none has gone to
outrider. I checked out the POPwatch update docs (the only place
alias is mentioned) and it only gives a passing mention, saying if
you don't already know about it, you probably don't need it. :^(((

Mailfold is also not working for me, but that's for another thread.

This is all mighty funny! I wonder whether you have a problem with the order of the /AUTOs.

Another thing .... I had persistent troubles (mainly read erros during boot) after I had done a Magic re-install. I fiddled around for ages before running a disk diagnosis (Zorg) on C: which revealed that I had managed to create some duplicated clusters somehow. When I re-installed the few files involved in this everything was fine again. It might be worth you doing this just as a check.

BTW, I never discovered what was responsible for writing the bad files.

I have all CPX (Magic, NVDI, STiNG etc.) saved with the settings I
need. I use COPS as CPX manager - this will run them up at the right
time and do the initialisations. You can also install COPS to disappear
after a set time (I use 2 minutes which gives time to do any
additional settings) so you get the memory back pretty sharpish.

Well, since I got bigger faster drives and HD driver v7 I've had this problem too:(My Falcon was supposed to be fitted with a clock patch and I've got Nemesis. I think it's also due to the resolution you're working in? The same as the modem rate, the higher the res the slower the baud/SCSI rate. Try dropping the res a bit and see what happens.

Is parity disabled on the harddrive? The MSTE's SCSI-host interface does
not work with parity. (But it is possible to modify it to support parity)

Good luck!

/Peter

Download the source and re-compile it on your Falcon or
Ameoba. This should work with Linux as the rest of the
system is open source.

Youre down to looing out for second hand cards now dude.

d> (3) Where can one find out information about the Hard drive interface
d> card that Atari made for the Mega Ste. I have one installed, but can not
d> seem to get it to boot from the hard drive.

When you say it does not boot, can you boot from a floppy driver and then
access the drive at all, or is it totally out to lunch, maybe you have parity
eneabled, that would explain why the LINK II will talk to it.

d> The hard disk seems to work ok using the LinkII and HD Driver7.12 Any
d> ideas about this would be helpful.

Check that the drive has parity disabled, then make sure the driver is
correctly installed.

OOPs, NVDI 2.5 can't print ; It's only a VDI speeder. To print on a
color printer, you have to use SPEEDO GDOS or NVDI 3 or 4.

You could print on a deskjet in black & White with GDOS (i.e. AMCGDOS,
G+plus) but be carefull to use an old driver.

I am a bit surprised concerning Timeworks, because I used it, times
ago, with my deskjet and GDOS.

If you like, I can send you a HP deskjet driver for GDOS, and a color
HPDRIVER for SPEEDO by mail.

Just did so, and unfortunately, it behaves exactly the same. :^(

Another weird thing that happened was somehow my O.PRG got deleted.
I had that happen before with a couple of messages I had saved in my
Okami directory. When I went back to get them they were gone. I
just chalked it up to Okami not wanting 'foreign' files in its
directory, but this time one of its own got deleted. Have you ever
heard of this happening?

Thanks for your efforts.

Though that memory is very likely to be fragmented, so it may not do
you any good. I have MenuInfo display my largest free block of
memory, and when I disable COPS or let it shut itself off, it shows
no difference once it's gone. I'm sure the memory is there, but it's
just in a small block, which may or may not be useful, depending on
its size and your programs' needs.

You're right, but you're taking an /additional/ 2Mb off. It's
actually 16Mb of RAM (4x4), but the Falcon can only use 14Mb of it.
Most people just say they have 14Mb, so that's probably where you got
confused, thinking they were referring to the total RAM, rather than
just what's available.

On Tue 07-07-98 10:20, Terry May scribbled:

>I created an alias file, but it's not working, for some reason.

I solved this problem. POPwatch is on a different partition from my mail folder. I copied the alias file to all three levels of my mail directory (as opposed to my POPwatch directory) and it worked. Now I just need to experiment with which one of the levels is the one needed (probably the root, from what you told me). :^)

>Mailfold is also not working for me, but that's for another thread.

I figured this out, too. I had mailfold.inf in my main Okami folder, instead of where the sample file told me to put it. (Docs are a wonderful thing, aren't they? ;)

Unfortunately, my V1.34+ o.prg file got deleted again, this time along with o.rsc. Might have to resort to making them read-only.

Aside from that, my Okami setup is really coming along nice. I'm liking this program more every day. :^) Even the LFN problem doesn't bother me too much, ATM, since I have a good non-VFAT paritition for my messages. (Still would be nice to see it fixed, though.)

Hi Terry,

Just put the FONTSEL PRG in the UTILITY folder of MagiC and in the
magx.inf file put the environmental line as below and it works fine
calling the font selector as reqiured. The xUFSL is not required in
the auto folder.

aFTP is working fine now that I have xmen_mgr.prg installed.

As for online use, I can't use any version of aFTP greater than 1.3b1 without it crashing when _uploading_ to my workspace. I can download with any version, though. Has anyone else experienced problems with aFTP while uploading? Even the most current version (1.4beta2) crashes after sending a file. If I reboot and login again, the upload is there. These crashes occur under STinG, running either MagiC or Geneva. But 1.31b1 works like a charm when doing uploads. Everytime a new version of aFTP is released I try a test upload with it -- always ending with the same bad crash.

Jo, yours is a _lovely_ site, beautiful opening image and wonderful
index (I mean list) of files, when I can get to it. Tonight I could
not access SENDLIST or PRG-IND: response was <File not found> every
time.
I wish you would add a text explaining that colourful image - Tibetan,
I presume. Even on a TT 16-colour screen it is amazing.

Cheers, Charles.

But how many Amigas do you want to use to do it? Rendering is strictly a number crunching affair. Rendering has nothing to do with the graphics hardware that makes the Amiga special. One Alpha machine running at 533 Mhz can probably do what 50 to 100 '040 Amigas could do. Just the savings on power consumption would justify the use and purchase of ONE Alpha as opposed to upty million Amigas. And the Titanic people were using a FARM of Alpha's to do the rendering. And yes, other tools were used to generate the scenes. If I remember correctly Mac, NT, and Unix boxes were used to generate the scenes.

>correctly Mac, NT, and Unix boxes were used to generate the scenes.

I doubt that a Unix shop like D2 would put up with Mac
& they likey only put up with NT because of it's market
inertia/vendor support.

NT was the frontend, Linux was the backend. Although a
port of Lightwave to yet another Unix shouldn't be too
strenuous...

I'm using 1.4b2 and have no problem uploading. Maybe it's choking on
something your server is sending back when it's done.

Last night I had aFTP crash when trying to connect to a site that
couldn't be resolved. But I rebooted and tried again and it still
couldn't resolve the host, but it gave me an alert instead of
crashing. Go figure.

There is under the 'Options' dialog which has a save dictionary selection.

In Papyrus 4 you could use several dictionaries at the same time even from
different programs.

This is not possible under Papyrus 5.

The easiest way to find out is to ask Geocities.
Since they're actively looking to attract web pages
to support the accompanying advertising, it seems
to me they should have a WEALTH of general-purpose
CGI programs available for use. But I'm just guessing.

YMMV. (Except in the UK, where it's YKMV :-).

Only MIDI Out is functional, there's no MIDI In. And where do you plug the
dongle on a PC ?

Cheers,
Nick

> with MAGXBO32.PRG. That will protect your MagiC kernal in memory.

BTW: not long ago i replaced my cd-rom-driver by using SPIN! with the
SPINMAGX.XFS (i think itï¿½s called like this) in the START-folder. since
that time iï¿½m not able to use MAGTOROM.PRG. everytime i boot up, there
is a message on the screen saying "to few memory. MAGTOROM not loaded"
or similar. at least, my falcon has 14 MB RAM....
pehaps this problem is caused by XBOOT. as XBOOT is done first, the
SPIN! driver will be loaded once starting Single TOS and twice when
MAGXBO32.PRG is done! so a message on the screen appears saying
"SPIN! already loaded".
but iï¿½m not sure. i only found out when i tried to use my old
cd-rom-driver that it wonï¿½t work anymore... ;-)

so long, -micha-

> email address when replying to these emails?

You don't need to use the passwrd file for this. POPwatch can look for
an alias file and that's what I use. There was a thread about this a few
months ago.

POPwatch also use only the first recipient of a message (sent in cc) to
make the login.txt file. It's another reason to use its alias file.

This file is an ascii one like this (mine at the moment):

```
---cut here---
magic_os pricard
ptg pricard
bbeck pricard
hall pricard
postmaster pricard
---cut here---
```

You have to put it 2 (folder) levels under POPwatch, or at the root of
the partition if there isn't enough levels (as I did).

all circumstances together brought me to this conclusion: must be a
hardware-related problem. whatever, i dont know the STE, but perhaps its
the same fault. and maybe its caused by the chips getting older, that
would explain why it occures just after a few years (in my case).

Message-ID: <FN_35a17478_roughley@news.dsoe.com>
Source record: 97657

Is there anyone out there using the combination of MagiC v5.11 and Imagecopy v4 on a NOVA-equipped TT or Falcon? I simply can't get the program to run without it crashing, yet under normal TOS and Geneva it runs fine. My MagiC setup is barebones, and all the other programs I normally use are running great. Hours of work trying different things to get Imagecopy to co-operate under MagiC have been fruitless.

Any help would be appreciated.

Hi All

MAGXBO32.PRG MAGTOROM.PRG should run **before** Xboot or any boot manager. Magic and spin will load then xboot starts select the sets then boot. Using the programs this way protects the magic kernal strait off. Spin should not clash with MAGTOROM.PRG.

SPINMAGX.XFS has to be in the magic *extension* folder not the start folder it is a system extension also the fast ***DEV_FPRNDEV*** print extension should also be in the *extension* folder not in the start folder Putting them in the wrong folder will cause clashes. The spin docs say to put the files there as well as magic docs.

All the best. My system TT MagiC 5.11 NVDI 4.119r HDdriver 5.13 my friends Falcon 14meg ram same set up works fine.

Hi Pascal,

well I'm not sure. Grabbed the archive from the Revolution-7 CD too, checked
it again and once more fVDI crashed on it. Tried to load the font into
Image, an old drawing prg that handles GEMfonts too, but it complained with
"image too small"... something that normally won't happen with regular GEM
fonts. Guess it might be a corrupt file from the original source...
The docs I got say nothing special about it, in fact it's not even mentioned.
Only line in the "review" I got is: "support for GDOS/NVDI etc."

Any news on Papillon 3.0, supporting more than 256 colors??? Or maybe not,
but then at least able to run in more than 8 bit mode????? That's one thing
pissing me off, a ninetees program not even being able to run in TC mode...

Shame on you, ASH!

The communication between the modems and the dropped packets in the STinG
counter are something different, AFAIK.
The CRC-errors are corrected by the modems simply by repeating the
transfer until CRC-sum is OK. But I don't know exactly for the counter in
STinG. It must have to do with the further passing on in the system.

hi there,
hm. maybe iti¿½s like that, i cani¿½t remember at the moment where exactly i
put this files, wether the START or the XTENSION folder. ii¿½ll check
this. thanx for the tip.
but, one question left: isni¿½t it the aim of a boot manager to choose
between a MagiC and a Single TOS setup? once running MAGXBO32.PRG, you
cani¿½t return to Single TOS, AFAIK. is that wrong?

okay, getting the facts right, i haveni¿½t used sTOS for a looooong time,
so it wouldni¿½t matter at all, i guess. maybe iti¿½s the only way to go,
hm?

greets to everyone who helped, c.u. -micha-

hi louis,
hope ii¿½ll get my 3.0 update this week. as ASH announced, papillion is
completely new programmed in many parts (even smaller and faster in many
functions), so ii¿½m excited what it will be. it will be able to handle
gfx in TC - no matter which colour resolution.

lets hope the best ! c.u., -micha-

Hi,

I am looking for a postscript driver for Signum.
Is there anyone available?

Is it possible, to export Signum-Files to word or other pc-based
Text-Editors?

Thanks in advance,

Thorsten Lï¿½ck

Linux/68k ~ Linux/Alpha...

It's the OS, not the hardware that's the central
point. D2 is a unix shop so any other Unixen fit
in rather easily there...

That will do for me John :-)

My problem is that I'm left with a sorted, but only 50 per cent completed
full group list. If the original is left untouched, then that will be quite
useable.

Kind regards
Mike Kerslake

If that is the case you can still do it with most things with a CPU
and now Linux. You can run Linux and MiNT on a ST, so a ST can do it,
so what is the bid deal?

2251. Atari Times survey

Newsgroup: comp.sys.atari.st
Date: 1998-07-07 00:00:00 UTC
From: Colin Polonowski <polonowski@zetnet.co.uk>
Message-ID: <6ntcj5$j5g$1@irk.zetnet.co.uk>
Source record: 97681

Hi all!

I'm not sure how many of you read my HTML magazine 'The Atari Times', but I thought this would be one of the best places to ask a few questions regarding its future.

My intention for the Atari Times is for it to be a 'serious' Atari magazine in HTML as opposed to a 'scene' diskzine. To date, there have been 14 issues of AT, and issue 15 is due for release on 15th August.

I am trying to cater for as wide an audience as possible, so I would appreciate your opinions on the following subjects:

Atari News
Do you feel that it is best to include full press releases, or just to extract the relevant pieces of information?

Reviews
Are there any areas which you feel are currently not being catered for (in terms of reviews) in both AT and the Atari magazine community as a whole?
What sort of products should we review - educational, games, serious, hardware etc?

Features
What sort of features do you like?
Do things such as the excellent Emulators article by Matthias Jaap interest you?
Do you like to read tutorials (such as the HTML made EZ series)?

Interviews
Do you like to read interviews with influential Atari users?
Who would you like to see put in the 'hot seat'?

Advertisements
Are the adverts from various Atari supporters of interest to you? Would you like to see more of them?

Contributions
Are you able to contribute to AT? Have you got any other suggestions?

Can you please send any replies either preferably directly to me at polonowski@zetnet.co.uk or to this newsgroup (I hope I don't miss any!)

Thanks for taking the time to read this and I hope that the responses I receive enable me to improve the magazine in the ways you want :)

Cheers,

```

Hi All

The american dictionary of v 4 is not compressed so you can use it in
v 5x rename the extension to tlx I think or start a new personal
dictionary see what extension papyrus gives it. Change the extension
on the american dic load it in papyrus and save it uncompressed and it
is now usable.
Regards

Hi, I've got the Paula25 MOD player setup on my Nemesized Falcon, and it works okay, but whenever I try to play (any) MOD with Newsie running, Newsie won't download any messages or files. It blows up the dialog box, and shows the CPS at 0, then hangs there, until I stop Paula, and then it downloads the message/file. Anyone else have this problem or any suggestions how to solve it? I'm using Neodesk/Geneva as well...Thanks!

Message-ID: <35A18D7F.891E2AC0@studio9.demon.co.uk>
Source record: 97740

Emmanuel is right, Ethhoack is wrong ...

c does not equal c++ although they are commonly confused, its a separate language whose syntax is based on C (procedural) with object extensions for object-oriented programming, all that encapsulation, inheritance and polymorphism stuff - C++ has its roots in C (CPL/BCPL/B etc) and Algol and Simula which were early (1960s+) OOP languages

see 'Object-Oriented Programming with C++' by David Parsons 1994 (DP Publications, ISBN 1 85805 089 8) for an excellent and inexpensive introduction

WRT Dave Simes original question the only C++ compiler is the GNU C++ (G++ ?) which is a rather under-specified extension to GNU C, its also a bitch to get going and I'm sad to say that I abandoned C++ as a development environment on the TOS platform. However I'm not that much of a propellor head so if Dave or anyone else does us GNU C++ with success let me know and I will be your underling and willingly learn from your superior wisdom ;)

PS Ethhoack (WRT to later postings) I regularly use Ataris, PCs and MACs for personal and professional use and, wait for it ... THEY'RE ALL BRILLIANT Capitalism, dust-bunnies and teeny pop sensation Hansom are the real enemies Ethhoack not boring old they'll-get-swept-away-sooner-or-later Microsoft ... so get your facts right ...

Source record: 97741

I really hate to get involved in these flame wars, but the MSFT/INTEL consortium does have a tremendous on our computing needs. Why does every web page have hundreds of true color(16million color compressed JPEGs). Most PC users are on the web at 256 color mode. An 8 bit GIF, and a 24 bit JPG are about the same size, however a page full of GIF's will come up on my F030 in seconds, whereas the JPGs take minutes. The unnecessary and redundant compression schemes makes the web nearly unusable for the older computers. Real Audio, Real Video, MP2, MP3, PDF. These are all common formats that we cannot use on our Atari's. Lack of portable file standards will kill any platform. Most of it is done to make the average computer person think that they need a faster computer. MSFT and INTEL are the leaders in implementing standards that eliminate other platform.

Just my thoughts, I'm tired of waiting those extra minutes so that Yahoo, or excite can decompress those little banner ads. A 32x32 pixel ad does not have to be in true color.

I'm not a fanatic, but I am annoyed at the lack of compatability;

2269. Draconis/Adamas web package

Newsgroup: comp.sys.atari.st
Date: 1998-07-07 00:00:00 UTC
From: NOSPAMwplatt@bellsouth.net
Message-ID: <yigo1.621$%%6.462476@news4.atl.bellsouth.net>
Source record: 97742

Has anyone got the Draconis web package to work. It crashes on my F030. I got the dialer to connect, but when I tried to go anywhere on the web, an error message popped up that said "cannot find host" and it just kept popping up every 3 seconds.

I hope they get this package working because the package is real easy to install, and the adamas web browser looks to be a well done program. I used the adamas browser on offline pages, and it smokes compared to CAB on the same offline pages.

Thanks, I had that link in my Hotlist, but didn't make the connection between Draconis-Adamas.

In any case, I downloaded the latest version and tried it out in ST-Med. The interface looks decent (I like the % counter when loading pics). As expected, I didn't see any improvement in picture quality (what can you do with 640x200x2?). If anything, it's worse, because it doesn't (AFAIK) ofter half-height image display. That probably makes for a slightly cleaner image, but it throws the scale out of whack.

I'll have to check it out again when my Falcon gets its wings back.

> anything Atari:

Hall,

As always, you've got great Atari support going, but I didn't see any links to my Atari site, home of the Atari TOS Desktop Survival Kit. The Survival Kit explains just about every line in the DESKTOP.INF and NEWDESK.INF files, and offers tips and suggestions for customizing them.

Whether or not you include a link to this site is up to you, of course, but I think it's a handy resource, deserving many links. ;-)

Currently, the URL is <http://ic.net/~tjh/atari/>, but that will be moving in the next month or so as I rearrange my site's directory structure. My main Atari page will then be <http://ic.net/~tjh/computers/atari/> (the current URL will be a page pointing to the new location, so existing links won't break completely).

Regards,

Tom

As you probably already saw in a later message, I figured it out, but
thanks.

>Yeah. At the time I didn't know about Okami, and I actually thought
>NOS retrieval format would die a death on the Atari. But then along
>comes Okami and it's got a new lease of life :)

The alias file is nice, but if it doesn't allow for wildcards (I
haven't tested that), I wish it would. I'm always getting in new To:
addresses, and it's pain to have to update the alias file every time.
I'd like to just have one line: "* outrider".

>I actually meant to update the docs when I released NW 2.00, but I
>forgot. :(

No sweat. I'm just thankful it's in there. Even with what I wrote
just above, it still makes my life a hell of a lot easier.

>BTW, you'll be pleased to know, due to popular demand, I've started
>rewriting the main retrieval code in NEWSwatch to allow me to add in
>History checking for retrieval by number, and the long awaited KILL
>file processing. :-)

Cool. You da man! :^)

Are you going to allow crosspost rejection, as I asked earlier, too?

>On another note, I'm actually seriously playing with Okami now, and
>I'm very impressed. Won't be long before I can ditch Oasis2 for news!

Well, I never made it to Oasis, but I've all but ditched LED, using
it now only for Fido-type mail. Okami is great.

BTW, you need to add your address to o.inf, as your message came in
from root@ (I was having the same problem).

2277. BBS Software for TT030?

Newsgroup: comp.sys.atari.st
Date: 1998-07-08 00:00:00 UTC
From: Fourth Horseman <horseman@xmission.com>
Message-ID: <6o1av1$fu3$1@news.xmission.com>
Source record: 97500

Hey all,

I've been playing with the idea of putting up a local BBS, and wanted to use my TT030 for this task.

After searching the web, though, I've been pretty discouraged by the lack of modern BBS applications. Most of the BBS programs I've downloaded will not support the TT's extra serial ports (Modem 2, Serial 2, etc.) or they don't support speeds above 28.8, etc.

If I can't find a freeware/shareware application, are there any commercial packages still available? What happened to Ratsoft & Forem, and BBS programs like these?

Any suggestions, help, URLs to good BBS software, etc. would be greatly appreciated.

Best regards,

- Fourth Horseman -

optimised point with the variable resistor, desolder variable resistor, notify
the work point (ohm) and replace it with an static resistor (1% tolerance)
(metalfilm resistor) That works fine. Also for aFTP, MagiC and all what i have..

But a point for people they know what they do only..
It's a bit tricky and not a job for fucking 10 minutes..

>If you are refering to the "clock fix" for the Falcon (more or less
>required to run Cubase Audio - which I do), then that was done a long time
>ago.
>
>If you're refering to a software patch, which program in particular? I
>thought I'd pretty much used all the necessary patch PRGs...

Well, cubase, steinberg and this hole 'family' are talking only for
they own stuff, not for general problems. Falcon DMA / SCSI is a
master problem of that great machine. If you have a stable DMA /SCSI you
allways have stable software. e.g your software, include cubase, works fine.

Sure you only have terminated the LAST drive at your external SCSI Bus?
TermPwr on one (ore more) drives is ON?
Whitch kind of SCSI terminatin do you use? Active or passive?
You only have an external SCSI Bus? (Not SCSI like C-LAB) ?? (internal/external)
That doasn't work well!

Some people here have the same trouble after connect new or some
more drives to the SCSI Port. Many people have trouble while connect
the FIRST external SCSI device..
The best way to fix that: ClockPatch (Hardware Fix)
That problem can't be fixed with a simple software patch. It's only
a hardware problem. Homebrewed by Tramiel money eaters.. :/

>Oh, and I said I was "waiting for the Nemesis upgrade" - meaning I haven't
>gotten it yet becasue nobody seems to have any in stock...

Yep, one more problem, made by Titan :->
While use the nemesis, you got all what you need.
(Includes a nice to use ClockPatch and a simple tricky DMA patch)

And last but not least, i have not only one SCSI ID left with more as one Falcon)
ScreenBlaster: 928x608, NemesisF030
929x608, FX-Board F030, 10 Meg FastRam, 40Mhz
Harmless Machine: 800x600, non accelerated, but also some SCSI Devices..

They are all very stable..

Sorry for english in easy words, learner, taking all from the web :)
Sometimes i can't understand all well, but i try it..

Regards, Robert

Maybe they don't accept the PASV mode. Look at your log file to know
this. If I'm right then you should try with Newsie 0.90 (according to
the docs, not tried yet, thank you John) or with Fiffi.

Source record: 97546
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi. I require the external DMA to internal DMA(20 pin header) Supra cable.
There is a choke on the internal end of the cable, which slides into a
groove at the back of the shoebox case.

Perhaps you have a Supra shoebox case with a dead Supra Controller and
wish to sell the above cable.

Alternately, I need to know where I can get a DB19 male end in case I need
to make the cable instead.
Thanks.
David

2292. WANTED: Info on Lawrence Wright [Australia]

From: xav@compsoc.man.ac.uk
Message-ID: <6nv0p6lif1@irk.zetnet.co.uk>
Source record: 97548

Not really the same thread, but the topic kinda covers this one:-

Does anyone know if MagiC 6 supports any more of the AES4.1 features. I've always been disappointed that despite several updates, and the fact that many of the other replacement AES systems are (or were trying to become) 4.1 compatible, MagiC _still_ doesn't support some of the features (such as toolbars).

This is a real shame, as MagiC really is the most viable AES system out there, particularly for those that don't want to get bogged down in MiNT. So does anyone know?

I suspect that the answer will be that they haven't bothered... again.

The WEB graphics don't bother me, it's all those little dumb ads and
banners. Why use a 16 million color format for a 32x32 picture that
cant use it. I browse at 640x480 256 color mode, which i also suspect
the majority of PC users are also at. That is a total waste, esp.
when you are going to compress those pictures down in a lossy format
such a JPEG. The big pictures, and actual content I agree thanks for
the JPEG, I don't want to download a 400k GIF, but those ads and
bannersWould look just as good in an 8 bit, or even 4 bit resolution.

The MROS file must be located in the Cubase folder that is below the
cubase.prg file, with all the other .rsc and .fnt files.

It also sometimes does this if you haven't got the key... hmmm... I get
the message with Cubase 2.0 on a Falcon too.

Cheers,
Nick

It's a boot manager for the Falcon.

Cheers,
Nick

Howdy,

You should have gotten a version of MROS with your version of cubase.
Mros is cubase's proprietary OS. Cubase won't run without it. Cubase looks
for a folder inside your cubase folder titled MROS with a version of Mros
in it. If you don't have a file named Mros??.? (where ? equals version
number) you should contact steinberg.

hope this helps,

David Klimchak

I have and I made it work very well. I did it to install IBM DOS v7.0 to
AT-Speed when I had my 520 ST

It requires the AJAX chip and a 1.44 MB floppy with density select output
on pin 2. These are becoming rare because the PC has been developed to make
the density select process software driven instead of hardware driven which
is obsurd in my opinion.

Stoop is a killer Falcon boot manager. Look for v1.05. A
registration key has been released into the public domain, too, to
unlock all its features (though most work even without it), since
it's now freeware.

>is it useful? can i eat it? ;-)

What's the screen size and colors of TT-Med?

After my Falcon died the other day, I've been stuck surfing with my STe in ST-Med, and let me tell you, it's not a pretty sight. One thing that helped was disabling all my TrueType/Speedo fonts and just using Monaco exclusively. The other fonts are almost unreadable without making them real large, but Monaco looks good even in 8 points (good, at least, for ST-Med).

>Just as an experiment I downloaded the demo version of Jens Heitmann's
>Adamas and displated some graphics from the CAB cache.
>
>The image display quality is AMAZING. Try it. How does Jens manage it?
>And why can't CAB do similar?

Hmmm...maybe I should see what it does with ST-Med, though I can't imagine it doing too much with that horrid res.

Again, the VAST MAJORITY of banners are in GIF format. Check your
cache, or better yet, if you see it moving (e.g. animated), you
know it's a GIF. All this fuss over JPEG banners is misguided,
because they are a relative rarity.

I have had the Falcon "Clock fix" modification done way back when I first
got my Falcon (since I use it with Cubase Audio). And now that I think
about it, the drive did this with STiK too.

Such as??

If you are refering to the "clock fix" for the Falcon (more or less required to run Cubase Audio - which I do), then that was done a long time ago.

If you're refering to a software patch, which program in particular? I thought I'd pretty much used all the necessary patch PRGs...

Oh, and I said I was "waiting for the Nemesis upgrade" - meaning I haven't gotten it yet becasue nobody seems to have any in stock...

>Sure, have a look to your SCSI wireing, use short cables.

Yeah, it does only seem to happen in 256 color mode - at least I don't
ever recall it happening in 16 colors. But then CAB in 16 color mode
ain't pretty (unless you like greyscale) ;^)

eh ! Neil I haven't seen your post before BUT I have just the same
problem here trying to use a greater version than 1.3b1 leads to crash
when I upload more than one, two, three files (it depends on the
number of files I try to upload) ... I had talked to the authors and
they asked me to send my aftp logfile ... but the strangest thing is
there is always nothing about the last crash in the logfile, so they
can't help me about the problem ...
Martin Byttebier has also almost the same configuration than me, but
he doesn't have this problem ...

:
: The image display quality is AMAZING. Try it. How does Jens manage it?
: And why can't CAB do similar?

Even in 256 color Falcon mode, the picture dithering is slightly better in Adamas then in CAB, things look sharper and brighter. I'm not sure exactly what is done differently. But there is a downside in that it takes a bit longer for pages to display. On the other hand, because Adamas saves the *dithered* image in its cache, going back to the page is almost instantaneous. Somehow these cached images contain all the image data too, so I can download in 16 colors, and review later in 256 colors (the image will have to redither because of the new graphic mode, but it will have all the color information).

Its all very nice. I jsut wish it worked with STiNG. Draconis works well enough, but after noodling with STiNG until I got it just the way I want it, I don't fancy going through all that again with another IP stack. I know there were once plans to make a bridge module for Adamas to use STiNG, but I don't know what has come of that.

You need to run both NEWSwatch and POPwatch but you can run them at the same time under a multitasking OS like MagiC, so both mail and news can download at the same time. The advantage of having two programs is if you want to make a mail blink (say to send or check for an urgent message) you can leave news alone. With an all-in-one package such as NOS (which the NEWSwatch/POPwatch combination replaced for many of us) it was awkward (not impossible but more trouble than it was worth IMHO) to send and receive mail without getting caught in a news download too.

> I'll have a closer look at the documentation for those two
programs, but
> since I've never used them, and don't know how they work together
with
> Okami, what's the basic principle here?
> Apart from configuring "o.inf", what else is needed?

You set up POPWatch for mail and NEWSwatch for news, setting the type of setup you want (NOS format for Okami). In NOS format, both programs expect a standard directory structure, starting with an OASIS or NOS directory in the root of the drive:

OASIS-SPOOL-ARTICLES
-MAIL
-MQUEUE
-NEWS

The alias file (if you have one) goes in the OASIS directory.

ARTICLES is the news directory you have to set for Okami (incoming messages end up here in BATCH.TXT and O creates the newsgroup files here).

MAIL is the mail directory (incoming mail is stored here until imported into O).

MQUEUE is the outbound message queue directory you have to set for Okami (where both watch programs look for messages exported from O).

The NEWS directory is where NEWSwatch puts the newsgroup list, the history file and expects to find the GET file when you have one.

You can use MagiC aliases to create the directory structure if you actually want the data kept elsewhere.

I'm been using aFTP for a long time now. I never have had any problems with
except once. That was when I tried to upload something under STing. For
some reason the server didn't receive an EOF or something like that.
I believe though that this problem has been solved with the latest STing
release.
Under the setup I use right now, that is N.AES, freeMiNT 1.15.b8/mintnet,
Gluestik 0.03b3, aFTP 1.4b2 I don't have any probs.

Well it sounds strange, but yes, last night (in Belgium ...) I had
some problems to access my pages, but I think it's only momentaneous.

>I wish you would add a text explaining that colourful image - Tibetan,
>I presume.

Well, I don't understand what you are talking about, because the big
title picture on PRG-IND.HTM is only a title ... Is it the picture you
are speaking about ? if yes, there is no tibetan explanation about this ...

>Even on a TT 16-colour screen it is amazing.

Ah ! perhaps is it here we can find the explanation ... I will look
this page in 16 colors to see how the picture looks ...

Thanks for good words :)

Does anybody know what to do to fix an Atari Stacy Keyboard with non-working keys?

Is it possible to take apart the keyboard and re-seat the mylar membrane, or perhaps clean it? Or do I have to buy a new one

ospa

ospa@v-wave.com

2333. FS: Atari 1040STE computer and SC1224 monitor

Newsgroup: comp.sys.atari.st
Date: 1998-07-08 00:00:00 UTC
From: jk@panix.com
Message-ID: <6o0gr9$4if@panix.com>
Source record: 97588
Cross-posted to: comp.sys.atari.st,nyc.forsale

For sale:

1040 STE computer w/2 megs RAM
SC1224 color monitor
Alfa Data mouse
Wico joystick
All cables
Assorted software, including Sim City, Civilization, BaseTwo database,
bunches of old Start Magazine and PD disks
Various books and manuals

Everything works and is in good condition. You have to pick up the
computer and drop it 4" every once in a while to reseat a loose chip,
but that's what happens to old STs and it hasn't been a serious
inconvenience for me. If you can use an old 2400 Zoom modem I'll throw
that in as well.

$100 plus shipping takes the lot. If you don't feel like paying $100
make an offer, whatever you think is reasonable. I'm in Brooklyn, and
an offer from someone who can pick the stuff up and save trouble on
payment, packing and shipping will have a bit of an edge.

Hi,

I'd like to announce GEMJing 1.30 (1998-06-07) here because
c.s.a.announce seems to be inactive. I posted this three days ago but
it seems that it never arrived.

Name: GEMJing 1.30 of June 7th 1998

Type: Sound plugin; sample player. Plays WAV, DVS, HSN,
SMP, AVR and AU/snd (not all subtypes).

GEMJing is Freeware.

Description: Plays samples. Can be operated by other applications
(e.g. CAB) via remote control. Can act as an OLGA
server. Supports GEMScript. Can be controlled via
command line parameters or VA_START. Has a GEM
interface.

International version: Manuals in German, English
and French. Resource files in German, English,
French, Spanish, Italian, Latin, Fiji, Japanese,
Bishlamaro, Turkey, Esperanto, Swedish, Seeish
an Filipino.

Changes: - Bugfixed: WAV, AVR and SMP.
- no AV_SENDKEY when using Gemini as desktop
- MagiC-PC 6.0 supported!
- plays on the Hades040
- new: Swedish, Seeish and Filipino
- bugfixed: Turkey
- new command line parameters

Runs on: ST, STE, TT, Falcon, Hades040/060, Hades with
Startrack card, MagiCMac with MSND or
WeirdMac >= 0.64, MagiC-PC 6.0.

There be flames there...

There are reasonable arguments to suggest that Commodore and Atari got
their roles reversed between the 8 bit and 16 bit machines:

a) The Tramiels ran Commodore during the 8 bit days, and moved to Atari
in the 16 bit days. There are parallels between the C=64 and the Atari
ST designs that result.

b) Jay Miner was the designer of the chipsets for the Atari 8 bit
systems, and designed the Amiga hardware. There are *definitely*
resulting parallels between the Atari 800 and Amiga.

But both of these suggest a role reversal, and thus that Amiga and ST
are *different.*

The Atari ST has a BIOS that very directly parallels that of MS-DOS; TOS
looks a whole lot like "MS-DOS for the 68000," lacking most of the brain
damage of MS-DOS with respect to memory management and segmentation.

In contrast, AmigaOS was a multitasking OS from day 1, with no such
direct inspiration as can be seen with the ST. (Or at least close to
day 1 :-).)

--
Microsoft has brought the microcomputer OS to the point where it is more
bloated than even OSes from what was previously larger classes of
machines altogether. This is perhaps Bill's single greatest
accomplishment.

This is real close to what happened. Interestingly, my sources at the time
said Atari commissioned the Amiga as a game machine. Amiga's first product
was, as I recall, a foot pedal game controller that I sold in an electronics
store. Amiga the company was bought by Commodore who was in turn sued by
Atari. Commodore was at the time run by Jack Tramiels. He was ousted by
Commodore, he then bought Atari from Warner Communications who was running
it into the ground. Warner had bought it from founder Nolen Bushnell. The
ST was a successfull but hurried design which beat the Amiga 1000 to the
market by several months. I own them both, my Amiga is a small Amiga 500.
I like the ST but it cannot really compare to the Amiga.

We should take this off the linux group!!

Hi Ray,

I saw the options for load and save in the spelling options. What I
don't see is the ability to specify compressed or uncompressed. I
don't have v4 loaded ATM so I thought I'd get a bit of clarification.

Thanks,

Pat

: both from v4 and my user.dia file too. Terrific!

Keith,

Sorry, tried that.

When you disable the other dictionaries and try using the modified DIC to
TLX it will not function to flag words in a spell check or show suggestions.

Pat,

When you resave the file it will save the DIC as a compressed file.
When you disable the other dictionaries and only used this newly saved
file by itself (all other dictionaries disabled) it will not flag words or
give suggestions.

The Papyrus 4 dictionaries are transferable easily but are not
intergrated for use in the newer Papyrus 5 spellchecking.

Well, I don't see why it couldn't be an option. His request is
similar to mind for a wildcard in the alias file. They're both after
the same result, to create a single mail file. If it was an option,
people could still use it the current way.

>Tho' I can't say that I've run out of memory - yet! ;-))

Keep in mind that Ataris have no video memory, so your display takes
up some of your RAM. And the larger your screen size and number of
colors, the more memory it will take up. I surf the web in
768x480xHC on my Falcon and that eats up a pretty good chunk of
memory. Most of the rest of the time I use 768x480x16 and that takes
up far less.

Hi Dennis,

seems to be a well-known prob...
It is a damaged track on the keyboard mylar on the upper left hand
corner. Follow the track to the CTRL Key and rejoin it with a small
wire.

I've found this info in FUNKYWARE.ORG - TT_KEYBD.TXT - 11.07.1997
and got my keyboard fixed.

Good luck

Jochen

Source record: 97447

"Steve Adams" (adamss@ascinet.com) writes:
> Has anyone hooked up 1.44Mb floppies
> to a 520?

This might help:

I found this when going through some old disks. It still may be of
interest to some. The mod was originally written up for the local
Atari Users Group and presented at a meeting in 1993. Some updates
have been added.

Randy Kwak
bm827@freenet.carleton.ca

****

High Density Disk Drive Modification by Randy Kwak

What you need:

- CO25914 (Video Shifter Chip) contained by every Atari ST

- WDC 1772 02-02 chip (floppy controller chip) contained in most (newer)
STFM's, Megas, and (probably) STE's, etc. According to
"Atari ST Review (Mar., 1993)", 95% of these chips
will work at both 8 MHz and 16 MHz

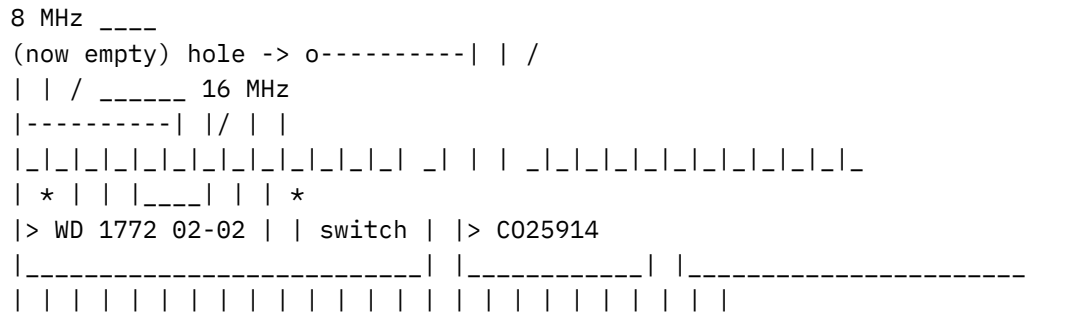
N.B. If your floppy controller chip is the older "00-02", it will
NOT work (but it will fry nicely). A chip upgrade is needed
for the mod. (N.B. I do *NOT* have or need an AJAX chip!!!)

- HD floppy drive
I have an older Chinon and TEAC with multiple jumpers which work
fine. Make sure you change the drive setting from "1" (typical
IBM setting) to "0" (Atari setting).
(1997 note: many recent HD drive have *NO* jumpers whatsoever
and may not work in an ATARI; see if you can try before you buy.)

What to do:

Desolder pin 18 ("clock") of your drive controller chip and bend it up
and out of the hole. Solder a wire to it. Connnecting the wire to the
(now empty) hole gives you an 8 MHz clock (double density). Connecting
the wire to pin 39 ("16 MHz out") of the video shifter chip gives you
a 16 MHz clock (high density).

I have installed a toggle to switch between 8 MHz and 16 MHz. My setup
is the following:



Formatting programs:

- Diamond Format (HD 3 1/2", 18 & 20 sectors per track, IBM boot sector)
- H-Copy (HD 3 1/2" & 5 1/4", selectable number of sectors)

Note that the normal formatting routine from the desktop will only give you DSDD disks. This is because the HD formatting routine was not built into TOS until TOS 2.6. You *MUST* use a software formatter or have pre-formatted disks.

Problems you may encounter: "Damage on drive XX; check connections.."

- On 3 1/2" floppies, change step rate for drive to 6ms or 12ms (Double Click's "Floppy Configurator" is great for this). Reason: when you double the clock rate, the step rate is halved.

- On 5 1/4" disk drives, change step rate for drive. Additionally, you may need to construct an interface to provide the necessary logic and buffering for the drive select and motor on signals. (1997 note: I can dig this out if anyone is interested).

- IBM-compatible floppy drive may not work in an Atari. Check first to see if it works as a normal Double-Sided Double-Density (720K) drive (no modification necessary - just plug it in after changing drive number to "0"). If the floppy drive light stays on all the time, the floppy drive cable is in upside down. If it doesn't work as a 720K drive, it probably will not work as a 1.44 drive unless you can set the jumpers and configure the darned thing (you would have to figure out how to do it on an individual basis).
(1997 note: most of the recently manufactured HD floppies do not have any settable jumpers and may not work in this mod.)

Usual disclaimer:
I have successfully installed this modification in a MegaST (TOS 1.4, 6-chip set) and a later-model STFM (TOS 1.2, 2-chip set). I do not know if it will work with TOS 1.0.
I cannot accept any responsibility for any damage to your ST.

In article <6n9137$5am$1@pale-rider.INS.CWRU.Edu>, Jeffrey B. Armstrong (jba4@po.CWRU.Edu) stated:

> Can an SC1224 monitor be used as an RGB monitor? I have a DEC
> Rainbow 100 that I would like to attach a color monitor to. It
> has RGB outputs. Can I adapt a SC1224 to accept signals from
> this computer?

I assume the Rainbow expects an RGBI monitor (vs. analog RGB, like the SC1224)? If so, you could get 8 colors by connecting the RGB lines straight thru, although you might want to install some resistors on the lines to knock the TTL-level outputs down closer to the normal peak signals of an analog input. I am not certain of the exact value, but 330ohms would likely be a good start.

Getting a full 16 colors would be a bit more complicated, more than I can explain off the top of my head.

> I would also appreciate the pinouts on this monitor.

Go to:
http://lwp.ualg.pt/docs/hwb/co_AtariStMonitor.html

Note that this pinout actually covers the video output on the ST. The SC1224 only supports the R,G,B, sync, audio, and ground lines mentioned there.

I'm affraid that the best software for this task isn't on the net... I didn't
see yet anyway :-)

What you need is Semper for the mailhandling and to pickup the phone and
Octopus as bbs. Actualy ,Octopus can be setup without semper but then you
can't use fidostyle networking.

h> Any suggestions, help, URLs to good BBS software, etc. would be greatly
h> appreciated.

Sorry,i have no idea. But Semper is downloadable on most Atari based bbs
systems.
Octopus is a bit difficult... If you can't find it i can put it on my page.
Just let me know.

Be sure you get Semper version 0.80 or higher (0.81) ...

Maybe that Semper can be downloaded on www.bearboard.demon.nl..

>Microsoft-based 'wares'? Check your log and let me know.

He,

I don't think aFTP is to blame for this. For me it looks like STing has
some troubles, but ofcourse I can be wrong. It certainly has had some
troubles in the past but these are maybe solve by now so make sure you've
the latest release of STing.
Anyway all my uploads are going to a Micro$oft server and I never had any
probs. Even with the latest version of aFTP I can do multiple uploads.
Note:I'm using MiNT/MiNTnet/gluestik.
What Jo concerns. I really doesn't understand why he has troubles as we
are using almost the same setup and the same ISP. The main differents
between Jo and me is that he's using Geneva/Neodesk/MiNT 1.12.4(?) whereas
I'm using N.AES/Thing/MiNT 1.15.b8.

If the name of the list appears in 'From: ', 'Sender: ' or 'Reply-to: ', the
answer is yes. It's not always the case (I think about the mint mailing
list for example).

What's new in NVDI5, does the threading work?

mk> wdialog is still mysterious to me. i thought i won't need it if i
mk> use magic (>5.0). isn't that right? (sorry, i didn't follow the
mk> discussion about that theme... but there seems to be a lot confusion
mk> about it!)

There is a lot of confusion! :-)

As far as I can tell it was written to add some of MagiC's features to
ordinary TOS, but in the process a few extras were added, which means that if
you want to have access to those then you have to run WDialog with MagiC. In
any case there are few if any progs that use these extra bells and whistles
AFAIK, in fact it can interfere, for example Texel loses all of its print
output dialogue in favour of a more-or-less useless replacement from WDial

That's my understanding of the situation anyway! :-))

r> statement,
r> having heard this before: Should the CPX be saved with preemptive
r> multitasking 'off', or is it safe to have the CPX saved with it 'on'?

Open your CPX manager, set m/tasking to preemptive with the CPX and save it.
You don't need to have the config CPX set to be permanently active, just so
long as its name can be seen in your CPX manager.

r> In other words, should it be turned on from the desktop just after
r> booting? I've tried both ways and MagiC runs fine (except
r> Imagecopy). Perhaps a minor detail but I needed to ask.

It'll happen autmatically when the CPX headers are loaded and activated.

>> Also, make sure you're using MAGTOROM.PRG in your AUTO folder,
r> I tried magxbo32.prg in the auto folder but Imagecopy still crashes.
r> I couldn't find the file magtorom.prg anywhere,

That's not in the MagiC distribution, I got my copy from either Thomas Much
or Uwe Seimet's home page IIRC.

Yes, that's true - you'll also find that you'll get more resends with file transfers if you're running a high colour res and a high port speed.

Returning to the SCSI problem, there was a note about it in one of the early issues of Atari Computing, the outcome of which was that it might be worth trying another hard disk booter.

>> installed them both at the same time.
>> I don't think it's STinG, as this was happening to me before I
>> installed it.

I don't think that it's caused by STinG either. I sometimes get the same problem, but with the internal IDE drive (which holds my offline message bases) in this Falcon as well.

I think that it is asscociated with opening a lot of files at once, if I run my Fidonet mailer as the first action of the day I can almost guarantee that the system will "hang" for some tens of seconds before Jetmail continues scanning for mail. Oddly if I run some other program first then it's completely reliable. MagiC 5.11 and a Nemesis card.

mk> it's a mystery to me - i don't know what to do. i'll try the
mk> clockpatch in the near future (needs some free time, which is rare
mk> these days ;-)).

I'd recommend fitting a Nemesis card, it'll speed your Falcon up and it includes a clockpatch - but see my comment above about the IDE.

mk> the only thing i found out: it is resolution-dependent. in
mk> 2-colour-resolution sometimes it works better, but not in any
mk> case. any good ideas about this ?

Yes, it's due to more bandwidth usage by the higher video mode. Again I recommend a Nemesis (how good is your soldering?).

Speak to 'ya later!

2389. New at Systems For Tomorrow (July 9th)

Newsgroup: comp.sys.atari.st
Date: 1998-07-09 00:00:00 UTC
From: sales@SystemsForTomorrow.com
Message-ID: <35a50d83.0@199.79.146.67>
Source record: 97473

New at Systems For Tomorrow July, 9th 1998
~~~~~~~~~~~~~~~~~~~~~~~~~~

Scribble Synth for TOS Computers $29.99
This program is a software-based sound synthesizer. Scribble Synth is a true additive synthesizer, but with a difference, You actually draw in frequency envelopes with the mouse! The results are quite amazing. Strange Sci-fi Warbles, time-based pitch and filtering effects, plus frequency modulated sounds are all possible. From Electronic Cow.

EC-909 for STe/TT/Falcon Computers $39.99
EC-909 is an analogue drum machine emulator for the STe/TT/Falcon. It features sixteen origional TR-909 sounds with various controls. EC-909 can create single bar patterns in real-time, and then export them into your direct-to-disk recorder or sample editor as AIFF or AVR format samples. From Electronic Cow.

Select CD For Falcon030 Computer $29.99
This CD contains the latest versions of some of the best Falcon specific Public Domain, Shareware and Freeware releases. Including games, demos, graphic programs, music programs, product demos and more. From floppyshop.

Sound and Stuff CD for TOS Computers $39.99
The Atari Musicians Toolkit. Includes hundreds of music fines in MOD, SNG and MIDI formats, Masses of superb quality samples in AVR format. including: Drum loops, percussion, synthesized sounds, acoustic instruments and effects. Lots of useful utilities for musicians. Music and audio programming information. A vast collection of MIDI and Sound related PD/Freeware/Demos/Shareware programs for the Atari. Complete version of Sound Chip Synth v2.32. From floppyshop.

Pix Art 4 $69.99
Latest version of the popular art package. Now supported by Homa Systems House.

Atari Computing #9 $9.99
Atari Computing #9 is here! All subscribers have shipped, limited quantities of issue 9 still remain.
Ordering Options:
Single Issue: $9.99
Standing Order: $11* per issue (must have a credit card)
3 Issue Subscription: $30*
~~~~~~~~~~~~~~~~~~~~~~~~~~

6 Issue Subscription: $55*
*Includes shipping to US or Canada.

MidiPlay $49.99
This is a player of MIDIFILE without additional hardware for the Falcon030!! It plays the MIDIFILE with digital sounds! Features: Play all the MIDIFILE following the GM norm * Up to 24 voices on an normal Falcon * Each channel have a dynamic polyphonic voice. * You can change the sound of current channel. * Function SOLO (play only the channel), MUTE (not play the channel). * Viewing of volume, information for each channel, bar, time, etc...

Digital Home Studio $129.99
This is a 32 tracks editor/player of audio/midi channel tracks for the Falcon030. With DHS you've got a editor of track, a sampler, a multi effect and an station of Direct To Disk! Features Include: Up to 64 audio channels (depending of your speed system) * For each track, you can programming anywhere in the music, the panning, volume effect, the volume, master volume, etc... * You can put or stop an effect anywhere in the music. * Up to 9 octave to replay audio sound or Midi sound. * Sound up to 50Khz 16 bits stereo * Up to 12 track in Direct To Disk (C.D. quality) * Up to 32 Midi Tracks * Mix audio tracks, D2D track and Midi Track in the same editor of track. * You can put a D2D file anywhere in the sequence * Digital Effects (Echo, reverb, flanger, equalizer, etc..) avaible on audio track or in the sample * Without quitting DHS, you can sample and work on sound (cut, copy, volume, autoloop, etc..). * Sampler avaible with Digital Effect (Reverb, etc..)

Expand $64.99
EXPAND emulates a Midi Expander on your Falcon030 computer. Loading audio sound, you can plays them even in D2D. Features: Play instrument like a Midi Expander * Use Audio instruments with multi-sample, envelop of volume, pan,... * Each channel have a dynamic polyphonic voice. * Use the 16 Midi channels * Understand the most of Midi messages like program Change, Note-on (with velocity), Note-off, Pitch,Main volume, Pan pot... * A very good interface.

Live Machine $64.99
Live Machine is a D2D program for accompanying someone during a concert. Live Machine can be controlled by MIDI messages! For the Falcon030.

Fontmania CD $15.99
While this CD is not an Atari specific disc, it does provide a wealth of fonts usabe by Atari owners. Includes: 1900 Adobe, 200 Calamus, 1100 CG Fonts, 300 bitmap GDOS fonts, 170 fonts as IFF pictures, 130 Pagestream, and 1400 True Type. Other font types that require long filename support are also included. From Weird Science.

Also Available:
MIDI Arpeddiator $27.99 MIDI sequencer
Sound Chip Synth $19.99 Software synthesizer
Snippit Synth $29.99 Granular synthesizer
CAB 2.5 $49.99 HTML browser /w PPP socket for MagiC
Atari Works $79.99 Easy to use home/office suite.
Lattice C 5.6 $139.99 C Compiler.
True Image $29.99 Image Processing Package.
Alien Thing (Expert) $19.99 Alien Blasting fun!
Tetris II $11.99 Cool Tetris game
Desktop Solitaire $19.99 8 solitaire card games for TT/Falcon
Face Value $69.99 Visual style GFA programming
All Things Falcon CD $9.99 Tons of Falcon PD/Shareware on CD
Hard Disk Sentry $39.99 Optimize that Hard Drive
Photo Show Falcon $9.99 View Photo CD discs on the Falcon
Card File 4 $29.99 Personal Information Manager
Moving Pixels CD $29.99 Software Collection /w sources on CD
ESG Clipart CD $19.99 IMG, CVG and GEM/s clipart on CD
True Paint $19.99 GEM based paint package
Plus about 400 additional products for your TOS Computer!

2391. Prob with Daily Net in Oasis 2

Newsgroup: comp.sys.atari.st
Date: 1998-07-09 00:00:00 UTC
From: nigel@littlec.demon.co.uk
Message-ID: <64922999_000036_OASIS_NEWS@littlec.demon.co.uk>
Source record: 97475

Hi, I've had a stoppage with Oasis 2 when attempting to activate "Daily
Net".
I get the "Daily Net...reading News files" msg which stays up for an
abnormally
long time, followed by 2 bombs and the msg: "Program returned: 68000
Exception (Error #-69), with a cancel box which returns to desktop. I've got
over the lack of access to Newsgroups by reinstalling Oasis to another
partition on the HD. I'm wondering if I could rectify the fault by copying
the appropriate file to overwrite the damaged file which controls "Daily
Net", however I don't which file to use. Grateful for any suggestions.
Regards and thanks, Nigel Williamson.

SToop is OK. Avoid the latest release though as I have had it
freeze on me a few times, necessitating a reboot!
I'm actually experimenting with the French MENU Falcon boot manager
(up to .59 I think)and find it pretty good!

>some time now, but if it's not broke, why fix it?

They both have their strengths. Stoop is designed expressly for the
Falcon, so it's a much better fit. It's also easier to set up,
requiring no seperate configuration untility. Plus, Stoop is just so
damn sexy. ;^)

Best thing to do is just try it and see which one you like better. I
use Super Boot on my STE and I like it, but I prefer Stoop on my
Falcon.

I've been in that mailing list pretty much since its inception and
I'm extremely pleased with it. The mail moves very fast, allowing
for very active threads. The number of participants in the list is
already pretty large, including some 'movers and shakers.' And
despite rumors to the contrary, there has been no commercial
advertising.

In short, it's a very good list.

>would be to go through from 1 - 45 until I found the one I want. I was getting
>sick of doing that, and it looks like Okami is the *solution*. I can go
>straight to the article I want :)

Yeah, Okami's thread handling is nice. If you sort articles by name,
even if someone breaks up the thread and starts a new thread with the
same subject, it's right next to the other thread.

>I think this has been discussed before, but I can't remember too much
>detail. I think there was a reason I didn't add wildcards though. Just can't

>
>Is that where it rejects an article if it's been posted to more than a set
>number of newsgroups? Yeah, I think I'll add that :)

That's the one! That will be a great help in rejecting spam.

>I'm thinking of using the NOS kill file format for NEWSwatch, unless
>anyone can think of a better alternative?

I'm not familiar with it. Can you post a brief description of how it
works?

>Not sure about Okami for email though. I haven't studied it in great depth,
>but the address book looks a bit limited. Can it do mailing lists?

If you mean incoming mailing lists, it handles them VERY nice,
putting them in separate "mailfolds".

If you mean outgoing mailing lists, I'm not sure.

>
>Crosspost rejection can be done by Okami.

I think we're talking about two different types of "crosspost rejection." I'm talking about trashing any message that contains more than a predefined number of crossposted groups. So if you defined a maximum of two groups, and a message came in crossposted to three groups, it would be trashed and you'd never see it. (Great for getting rid of spam.) Ideally, you could give each group its own setting, because some groups are more condusive to crossposting than others.

Even if Okami did that (which I pretty sure it doesn't), it's still better handled by the mailer, where you don't download the crossposted messages at all.

Hi all,

I'm trying to access the URL http://www.dpt.com/ from home,
via both NEWSie and CAB, and I keep ending up at a Linux page.
DPT is a SCSI card company out of Florida. On the other hand,
if I try to access this page from work via Netscape, I get the
correct page.

Any clue? BTW, I'm using CAB 2.5 with the MintNet OVL and
NEWSie 0.88. Both produce the same result.

Thanks,

Michael White (michael@fastlane.net)

Yeah, I knew that. But some directories don't have those in them.

Those are the ones that gave me trouble. But thanks to the folks here, I
now know that BACKSPACE will do it in the absence of "." and ".."

BTW: I think ".." takes you back one directory.
And "." takes you back to the root directory.

>
>What do I need to do?

There's nothing you can do. POPwatch needs a return-path field to be able
to reject email. This path should exist but unfortunately isn't compulsory.
Without a valid address to send a rejection to, there is little POPwatch
can do. POPwatch's 'reject' option is only useful for junk email that does
include a 'return-path'. In my experience this is *most*, but it seems others
are not so fortunate. Nothing I can do about it unfortunately :(

>copied it to my POPwatch directory. That didn't work either.

Actually, this is wrong. Here's the proper explanation.

POPwatch looks for the ALIAS file in the retrieval path directory - 2.
eg. If you've set POPwatch's retrieval path to:
E:\OASIS\SPOOL\INCOMING\
Then POPwatch will look for the ALIAS file in
E:\OASIS\
If you don't have enough directories ie. E:\SPOOL\ or E:\SPOOL\INCOMING
then it will look in E:\

>I've gotten in mail from several of these addresses, including
>magic_os (which was also in your example) but none has gone to
>outrider. I checked out the POPwatch update docs (the only place
>alias is mentioned) and it only gives a passing mention, saying if
>you don't already know about it, you probably don't need it. :^(((

Yeah. At the time I didn't know about Okami, and I actually thought
NOS retrieval format would die a death on the Atari. But then along
comes Okami and it's got a new lease of life :)
I actually meant to update the docs when I released NW 2.00, but I
forgot. :(

BTW, you'll be pleased to know, due to popular demand, I've started
rewriting the main retrieval code in NEWSwatch to allow me to add in
History checking for retrieval by number, and the long awaited KILL
file processing. :-)

On another note, I'm actually seriously playing with Okami now, and
I'm very impressed. Won't be long before I can ditch Oasis2 for news!

On a lot of FTP sites, when you are in a few directories deep, there isn't always a directory entry for "cdup" or "cd .." that will take you to the previous directory. If you want to get back to the root directory of the site, you have to click the close window button - which disconnects you from the server - then re-open that site to be in the root directory. Is there a way to send a "cd .." or "cdup" command to the server from Newsie that I'm missing? MG-FTP has a button for this, and when I was FTPing using a shell/unix account with a term program, it was as easy as typing "cd .." or "cdup".

So, what's the deal?

I did not connect that list. i just responded to those who are not willing
to connect a list with commercial messages and a list where they have to fill
in personal data...

That is what is wrong with that list,as far as i know...

k>
>> I offered to setup another list when more than ten people are asking for

>> for another list.
k>
k> 11?

What made you think that ?

k>
>> I'm just offering my help.....
k>
k> Sure.

Look back the thread and you will see.......

What do you want from me ? If you don't like it just ignore it.
There where people complaining about that Magic list being a comercial one.
People had to fill in there names and more private things...

If you don't like me or something i am doing i am sorry about it. I'm not
loosing any sleep over it though....

2418. Damaged ZIP files???

Newsgroup: comp.sys.atari.st
Date: 1998-07-09 00:00:00 UTC
From: kenkel@zetnet.co.uk
Message-ID: <6o1ajbpdd1@irk.zetnet.co.uk>
Source record: 97520

Hi,

I recently zipped some files and copied to floppy, in order to make more room on my hard drive. yesterday, when I needed to refer to some of those files, I found that I could not decode them (with the same program - STZip or ZIP2TOS) and kept getting the error message: "THIS IS A DAMAGED ZIPFILE OR NOT A ZIPFILE AT ALL!"

It also said "USE PKZIPFIX". Does anyone know why I could Zip the files and yet be unable to unpack them again, using the same program? Why should they be damaged and what/where is PKZIPFIX?

Many thanks for any replies.
Cheers.
EDK

You may have to purchase a new mylar, as repairs sometimes are not
reliable, and minimizing the number of times that you have to disasseemble
the STacy is a good thing. Best Electronics sells the mylars.

Hmmm ... have you tried the "whois" lookup
at <http://rs.internic.net> or the Sam Spade
address digger at
<http://www.blighty.com/spam/spade.html>?

You should be able to get the email address for
the domain administrator as well as the chief
billing contact -- they would be able to direct
your question to the right place!

Lacking that, you could address your email to
<postmaster@geocities.com> and/or <root@geocities.com>,
both of which are almost ALWAYS available.

Good luck!

>As you probably already saw in a later message, I figured it out, but
>thanks.

Sorry, to have taken so long to jump in. Actually that's one of the reasons I decided to brush the dust of my Okami setup. In Oasis2 all articles are bunched together in the same thread. There are about 45 seperate articles in this thread, and the only way in Oasis2 to get to one I want to reply to would be to go through from 1 - 45 until I found the one I want. I was getting sick of doing that, and it looks like Okami is the *solution*. I can go straight to the article I want :)

>>Yeah. At the time I didn't know about Okami, and I actually thought

I think this has been discussed before, but I can't remember too much detail. I think there was a reason I didn't add wildcards though. Just can't think of it.

>>BTW, you'll be pleased to know, due to popular demand, I've started

>
>Are you going to allow crosspost rejection, as I asked earlier, too?

Is that where it rejects an article if it's been posted to more than a set number of newsgroups? Yeah, I think I'll add that :)

I'm thinking of using the NOS kill file format for NEWSwatch, unless anyone can think of a better alternative?

>>On another note, I'm actually seriously playing with Okami now, and
>>I'm very impressed. Won't be long before I can ditch Oasis2 for news!
>
>Well, I never made it to Oasis, but I've all but ditched LED, using
>it now only for Fido-type mail. Okami is great.

I'm definately thinking that any day now I shall stop using Oasis2 for news
and use Okami. It's growing on me all the time :)

Not sure about Okami for email though. I haven't studied it in great depth,
but the address book looks a bit limited. Can it do mailing lists?

>BTW, you need to add your address to o.inf, as your message came in
>from root@ (I was having the same problem).

Sorted. I actually noticed I had to fix email address and date format too.
Hopefully it's all correct now.

> Martin Byttebier has also almost the same configuration than me, but
> he doesn't have this problem ...

The problems you describe are about the same as mine. These crashes, under both MagiC and Geneva, are so violent that aFTP doesn't have a chance to update its log. But 1.3b1 works so well for uploading, although on rare occasions I've seen it crash when doing multiple files. With newer versions, the crashes are consistent -- always at the very end of the transfer.

Because STinG and aFTP work so well for other people, I'm going to guess that it (aFTP) doesn't like the servers we're using. The one I'm using shows as this:

```
=> SYST
<= 215 UNIX Type: L8 Server: "WarFTPd 1.70.b01.02" OS: "WIN32 (NT 4.0
1381 Pentium 1-CPU)"
```

What is your ftp server using, Jo? Maybe the crashes are being caused by Microsoft-based 'wares'? Check your log and let me know.

It ends up the problem with Imagecopy and MagiC was my NOVA card.
Imagecopy always interpreted the NOVA's 15-bit mode as 16-bit, and for
some reason MagiC took exception to this. But I've got it working
properly now -- my MagiC installation is finally finished!

> thanks!!!! DAve

Parcp needs a special cable that you can get from Titan in the UK, or
that you can build yourself. The instructions are included in the parcp
archive.

I had problems with ghostlink in windows, but it runs perfectly well
under DOS. Try "restart in MS-DOS mode" instead of running it in a DOS
window.

Depending on what you need to transfer, you could try MIDI (for
midifiles) or floppies too, but that's pretty obvious.

Cheers,
Nick

I have not seen one commercial message in the list. And you dont have to fill
in personal data. What a bunch of crap. Dont bealive everything you hear.

>What do you want from me ? If you don't like it just ignore it.

I dont like the idea of splitting up the already small Atari community into even smaller
bits. Offcourse there are also MagiC PC and MagicMac users in the list, but the
main part is Atari users. The Atari user community is to small to have 2 mailinglists
with the same subject. Cant you see that ??

>There where people complaining about that Magic list being a comercial one.
>People had to fill in there names and more private things...

You didnt even take the time to join the list to see if those crap rumours was true.

>that program.

Oops!

OKAMI NEWSREADER MANUAL PAGES

NAME
cutlog: cut down log files

SYNOPSIS
cutlog.ttp { Options } pattern ...

DESCRIPTION
Deletes all but the last 500 lines from all files that match
one of the wildcard patterns `pattern'.
Optionally, deletes lines that are older than a given number
of days. For that to work, the lines must begin with the date
in the format "dd Mon yy", where dd is the day number, Mon is
the first three letters of the month name, and yy is the year.
Example lines:

13 Nov 93 18:59:10 Started "programname"
13 Nov 93 19:03:23 Terminated, exit code 0

This is the format created by the O programs.

OPTIONS
-d dir
Changes the work directory to `dir'. Wildcard patterns then
refer to files in that directory.
-l nlines
Deletes all but the last `nlines' lines from the files.
If `nlines' is -1, does not set a limit on the number of
lines.
The default `nlines' is 500.
-a ndays
Deletes all lines that are older than `ndays' days. Lines
must begin with the date in the format described above.
If `ndays' is -1, does not look at the lines' age.
The default `ndays' is -1.
-s nbytes
Ignores all files that are less than `nbytes' bytes long.
The default is not to ignore any files.

-q
Produces no output. The default is to print the name of
every file as it is processed.
-W
Prints a message and waits one second before beginning
expiration. If within that time the ESC key was pressed,
terminates without further action.
-v
prints version number only. Since cutlog is a general
utility and in no way affiliated with the O system, it
has an own version number independent from that of the
other O programs.
-?
Prints usage summary only.

EXAMPLE
cutlog -l -1 -a 10 -s 5000 -d h:/log *

This processes all files in the directory h:/log that are
greater than 5000 bytes, deleting all lines that are older
than 10 days. There is no limitation on the number of lines
left in the file.

You don't have to start two different Okami programs, of course. To
begin with, you can start Okami with different *.inf files. `o.inf' is
just the default configuration file, you can use option `-F' to
specify a different info file (install o.prg as `GEM takes
parameters'). Second, with oimport and oexport you can always override
the default `Mode' in o.inf, by using option `-M', followed by the
desired mode.

Please - I'm saying this for the umpteenth time - READ THE MANUAL!!

Yes, I "only" use Magxdesk. Aman.prg comes with it. The docs are in
German but what I understand is that avserver.app needs it for the "Font
Protokol".

Hi William!

This option refers to a nearly unused feature of TOS 3.0x and higher which
should allow to preselect your favourite OS.

Unfortunately a wrong setting will cause your computer not to boot from
hard disk any more. So be careful.
Usually you can only boot with either "TOS" or "none", "MagiC" does not
work.
There are rumours that "TT/SVR", "Unix", "Linux" or "NetBSD" should work
but I never saw this...

2446. PaCifiST and Xenon

Newsgroup: comp.sys.atari.st
Date: 1998-07-10 00:00:00 UTC
From: "Chris L"
Message-ID: <35a5fd46.10257897@news.demon.co.uk>
Source record: 97248

Hello there.

It's been a long time since I used an ST, back in the mists of time I was the Disk Editor for ST Format but moved onto PCs a few years ago and my STE lives under the stairs. Now I've discovered PaCifiST and it all coms flooding back. Wow the low-res desktop is small and the size of the icons!

However it's slow. My PC is just about the best, a PII 400 with 128Mb so I've plenty of horsepower but Xenon still jerks all over the place. It's probably just a question of getting the settings right. I can't be the only one here so is there a friendly list of which settings work best with which game? How good is PaCifiST anyway, am I asking too much? I would have thought that a 400MHz Pentium could emulate an 8MHz Atari at full speed but even the mouse pointer isn't smooth.

I'm going to try and get STAC working again. I have a massive adventure game I spent many, many hours working on that the world has never seen. I also wrote the best SHEUCK game ever...

dcroker wrote:
> Open your CPX manager, set m/tasking to preemptive with the
> CPX and save it.

oh, be careful ! i remember i had a problem with this.
my MagX-config-CPX (in version 5.11) seemed not to work properly.
i donï¿½t know why, but the settings had never been saved. and i wondered
why some programs didnï¿½t seem to work (i donï¿½t remember exactly which).

i only recognized this problem when i edited my MagiC-config-file
in an editor one day to set EASE as the desktop manually. the bit for
preemptive multitasking was not in the right state. after i corrected
this in the editor, everything was fine so far....

so (IMHO) donï¿½t trust in the MagiC-config-CPX too much.... check it with
an editor !!!!

same configuration here. i tried loading magxbo32 and magtorom first
this week. after that, magtorom weas loaded well. but i still had
problems with SPIN, which was still trying to load twice - think i have
to check my SPIN config once more.

and, after an access to my cd-rom, the window fresh-up seemed to be
in a loop, not only on the cd-rom-drive, on the hd-drives too. kept on
looping and refreshing until i switched my falcon off... strange effect,
i never had this before !

can anybody tell me which files i need, and in which directory ?
unfortunately i lost my
SPIN!-archive.... :-(, hope i still have all the files i need.

Hi,

A junk shop near me has a Golden Image handscanner with Touchup software
for sale.

Does any one have any experience of using one of these with a Falcon?
What's the resolution, how accurate is it, what's the software like, is
it worth it when I can scan things on a friend's flatbed scanner and
import them on floppy disk, etc?

Any thoughts and experience on this much appreciated.

I've never heard of any Atari dealers in Israel, but you can get a
joystick for just about any pre-PC computer. They all had "Atari
compatible" joystick ports : Amstrad CPC, C64, Amiga, etc...

For a hard disk, you'll get a standard SCSI drive, but the problem will
lie with the SCSI host adapter that you will also need. I'm afraid
you'll need to resort to mail-ordering from europe. Try Titan or System
Solutions...

Cheers,
Nick

> >>in the 16 bit days.
> >>There are parallels between the C=64 and the Atari ST designs that result.

The story goes something like this:

Once upon a time, Amiga was a separate company, with a development
contract with Atari to develop a new killer game machine. When the
tramiels arrived at Atari with a handful of ex-commodore people, they
more or less fired the Atari developers, and got rid of the Amiga
contract.

Commodore saw the opportunity and bought up Amiga, and the project with
it, since they were short of development resources with the resignation
of all the people who followed the Tramiels.

When Atari saw that the Amiga was going to be a hit, they got their acts
together and rushed out the ST concept, that was developed at Atari in
less than a year by many former C= developers.

I don't think many Atari people got to work on the Amiga, since it was
more or less finished when it got bought by C=.

>
> The C=64 and the ST was designed by the very same person.
> I can` remember his name!

The legend says that Shiraz Shivji was the guy who designed the ST.
Don't know if he had anything to do with the C64, but I wouldn't say
that the 2 machines have much in common.

What similarities are there between a C64 and an ST ? I actually see
more in common between an ST and a CPC really.

Cheers,
Nick

Message-ID: <01bdac1a$30a9bf40$6e2e27c0@tcpln.mk.unisys.com>
Source record: 97264

As I have been trying to get a copy of Legend (Bloodwych series, from Mirrorsoft) for about 3 years, I bet no-one in this group has it. I've almost given up, so someone PLEASE prove me wrong and send me a copy! If you live in the UK I will even send you a cheque for the original if you have it. I loved this game when I owned the original 5 years ago, and want it again.

The Legend I am after features 4 of the original Bloodwych characters (Murlock Darkheart is one of them?) and is iso-3D (as cadaver, Head Over Heels). There is a demon who scribes the map as you go.

I have a complete Mega ST4 system and a TON of software for sale. Sale is open to all. I would prefer to sell the whole package as one lot, but will consider offers for individual pieces of software or hardware.

Package Price: $400 (US)+freight, or best offer. Inquiries should be directed to:

WFChris@aol.com

The package includes the following:
Hardware
1 Mega ST4 & Keyboard
2 Monitors; 1 SM124 momchrome & 1 SC1224 color
1 monitor switch box
1 mouse
1 joystick
1 MouseMaster switch box
1 ICD 44 mb Syquest drive
1 SF314 external floppy drive
1 Cannon BJ10e bubblejet printer
1 Supra Modem 2400 (ok, its not very fast, but it was good enough for GEnie)

Software
Applications
Calamus v 1.09.6 & 1.09N
Flash
Clean Up ST
Word Perfect
Degas Elite
Data Manager
Word Flair
various utility programs such as NeoDesk

Games
Maniac Mansion
Empire
Star Wars
Gauntlet
Warlock
ArcticFox
King of Chicago
Thunderbirds
SimCity
Ancient Art of War in the Skies
Steel Empire
ShadoWorlds

Balance of Power (1990 ed)
Rorke's Drift
Railroad Tycoon
Storm Master
Populus
Power Monger
War in Middle Earth
Defender of the Crown
Lemmings

Steve Klosterman a crit dans le message <35A64816.15D5@ohio.net>...
>This may be something already discussed, sorry if it is, but is there
>any way I can make my Atari 1040stf read Mac disks or vice versa?

Yes, it has already been discussed a few weeks back.

It seems that both are supposed to be MS-DOS compatible as far as floppies
are concerned, so in theory, format a DOS disk to 720K on the Mac and use
that. Apparently, the person who had the problem found out that it worked
only if he formatted the double sided disk on a PC in DOS mode to 720K.

Avoid folders and long filenames.

That should be it.

Cheers,
Nick

Oh, so it's Server related. In the time I've been using Popwatch
(about a year and a half - since it was first released), I have been
able to reject exactly ONE bit of spam. And all others seem to come
in with a different To: or From: address every time - even from the
same spammers.

As such, the Reject feature is mostly useless for me, and the Killfile
has limited use as well, since it just sits there getting larger and
larger, as the spammers get creative with their addresses.

It would be nice if the Killfile could be modified to nuke mails from
a specified server. That way, then next time I get a message
addressed to 098845@earthlink.com, I could just nuke earthlink. (No
offence to Earthlink patrons, but it does seem like a lot of spam
originates from that server).

Is this a possibility?

>
Well, I had an ST and sold it the same day that I used a friends Amiga 500.
I bought an A2000HD. The Amigas graphics, multitasking, stability,ease of
use and range of good quality software that was unequalled at the time sold
me.
Games were generally better on the Amiga as well, as were the tracker
programs.

I'd rather own an A1200 thanks, AGA, easy upgrades, WB3.1 (no Atari OS can
match the capabilities), and Aminet for good quality software (much of it
free) makes the A1200 a winner.

At least we don't use Mac's eh?

k> 2 mailinglists with the same subject. Cant you see that ??

Yep. I agree.... As i don't have the time right now i can't see for myself.
So i will look at that magic list this weekend. From what i understand is
that people have to signup online ?

If so,what's the url ?

If i have to fill in more personal things,like address and/or other things i
go ahead and setup my list. If not and there are no commercial advertisings
on this Magiclist i will reconsider (excuse my bad english) my offer to setup
another Magic list.

>> There where people complaining about that Magic list being a comercial
>> one. People had to fill in there names and more private things...

In your AUTO folder you should have METAXBS.PRX (do not rename it to .PRG) and CONFIG.SYS. If you choose to, you can have your .BOS and .DOS files there, but you can have them anywhere, provided your CONFIG.SYS is configured correctly.

In your XTENSION folder should be SPINMAGC.XFS.

That should do it, provided your CONFIG.SYS is configured correctly. Here's mine for my STE:

```
; CD-ROM on ACSI 7
*BOS, c:\gemsys\spin!\spin_sd.bos, 0:7

; install as logical drive O:
*DOS, c:\gemsys\spin!\iso9660f.dos, -c64, O:O
```

From: wordwork*@ctos.com
Message-ID: <35a66cd4.0@news.weldlink.com>
Source record: 97283

Well, Newsie just threw away many messages from this newsgroup. Vers. 88 did this. I had noticed for the last few days that the group messages window was no longer sorting correctly.

I'm using Geneva, and was able to save the messages before quitting. Interestingly enough, the "no longer listed" messages stayed on the hard drive.

Is there anyway to force Newsie to reindex the messages? These are in my offline reading folder.

Thanks.

I've had a similar problem recently with the flexible printed circuit
foil on the control panel of a Volkswagen Polo. A track had broken
because the foil had been stretched around a projection on the panel.

The site of the break can be found using a multimeter and a couple of
pins to penetrate the track insulation.

There will often be terminal pads to which the bridge wiring can be
attached. Otherwise scrape the insulation off the track CAREFULLY and
solder the bridge using a fine tipped iron with minimal heating.

Yep on the home page of FaST Club one can find betaversions in the form of
upgrade patches of the forthcoming new release of Imagecopy (Imagecopy
plus). To use these betaversions one must be a registrated user of
Imagecopy v4 CD version.

If you're a registrated user I strongly recommend these betaversions.

2486. Jinnee desktop: Questions

Newsgroup: comp.sys.atari.st
Date: 1998-07-10 00:00:00 UTC
From: tos4ever@ping.be
Message-ID: <35a68028420d970@ping.be>
Source record: 97288

Howdy,

I try to set up the Jinnee desktop. So far everything is good only I can't find a way to start MiNT prg's like *uptime* from desktop. If I double click on the executable all I get is that Jinnee starts a viewer, in my case looknsee.prg instead of launching the executable.

My second problem is that the drive B icon always appears on the desktop no matter what I do. If I delete the drive B icon and save the setup I expect that that icon won't be there the next time I boot, but alas it's still there.

BTW: I'm doing this under N.AES v 1.1.7/WDIALOG2.01/freeMiNT 1.15.b8

Anyone an idea about this.

TIA
Martin

On the Falcon this has no meaning, only for the TT. You can select for
the TT if you want to boot TOS or the System V.4 Unix for the TT, if you
have it.

So Linux can now be booted directly from a Linux partition, i. e.
without starting TOS first? This is what this particular NVRAM setting
is about: To directly bootstrap different operating systems.

PKZIPFIX is a IBM Program from the folks who make the IBM Version of PK ZIP. It tries to fix the filesize, etc. Sounds like you somehow got a corrupted file copying them from your HD to a floppy or they went bad on the floppy. If you have access to a IBM Compatible PC, just try running PKFIX on it and it might allow you to get some or possibly all of your files back out of the corupted files.

Ratsoft is decent software, but I don't believe it offers anything
special for the TT, I also own BBS Express ST which I like better,
it's more user friendly along with Sysop Friendly. I don't believe
there's much support if any for Ratsoft, the programmer use to run a
BBS which you could get updates, bbs utilieis, etc from, but it quit
answering some time ago. BBS Express is still supported I believe, I
haven't called the Support BBS latey, but I have the # here if you'd
like to try it. Not sure if there's any other BBS packages that are
still supported for the ST or not.

Octopus is still very actively supported, is 030-friendly,
multitasking-friendly, multi-line friendly, CD-ROM-friendly, etc.
It's an extremely progressive, forward-thinking BBS program. It kept
me running a BBS probably at least a year longer than I would have
with any other program, simply because it's such a joy to use. It
was fun updating my BBS even when I wasn't getting any callers.

There is even talk of making it html-compatible, but that's not yet
written in stone.

: >
: >
: Hi Roger,

: well, I second Mr. Horseman's statement, got a TC1208 and my standard mode
: is 832x608 Truecolor (the card is 32 bit, 24 bit + 8 bpp overlay as they
: call it). Also with NVDI 4.12, perfect combo.
: The problem would be: there is a market, but how big? 100 pieces, 500 pieces?
: At what kinda price? You'll never get one for say USD 150,- I'm afraid.

: Look what's happening with RAMboards from Aixit... I ordered a board with 64
: Megs beginning of this year. Well, the old ones were all out and at the time
: they designed a new one for 256 Megs maximum. So in april Aixit told me the
: first batch of 100 was in production. Appearently my order was for the next
: production series, but in July I heard they postponed the batch in favour of
: production of boards for the Milan... So maybe (I mean MAYBE) I could get a
: board around september, october, november, whatever...

: Faster chances turning over every garbage belt you'll come across looking
: for a dumped Mega STE or TT with a card...

Buy a Milan. The board will run faster on the Milan than the TT030.

================================================================================
TOWNS' LITTLE GUIDE TO REVISIONS - VERSION 1.0
----------------------------------------------
Written by John Townsend, Atari Corporation
================================================================================
This is a small document that explains in very terse terms the
differences between the TOS revisions available for ST/MEGA/STE/Mega
STE/TT machines, what patches are needed for what revisions, the
formats
they are available in, and any notes I can think of.
I hope this will clear up some of the confusion with the different
TOS
versions. If you have any questions on this document, please let me
know here on GEnie. My GEnie Address is: TOWNS.
Special thanks to Leonard Tramiel, Allan Pratt, and Doug Wheeler for
their involement with this little Document. Thanks again!
Comments are welcome..

-- John Townsend
Atari Corp.

ROM TOS (TOS 1.0)
-------
The original ROM TOS, this version shipped in 520ST and 1040ST
machines.
It is no longer shipping in any machines.
```

Formats: 2 chip ROMs, 6 chip ROMs
Machines: 520ST, 1040ST
Utilities: FOLDRXXX.PRG

FOLDRXXX.PRG will add more entries into your OS Pool. In TOS 1.0 and TOS 1.02, the limit for the number of directories that you can enter is around 40. With this program you can extend that limit much higher. If you are using a hard drive, this program is recommended highly. It will work with all TOS versions and will improve the performance of your system.

Notes: GET TOS 1.04 TODAY! TOS 1.04 is the latest version of TOS for 520/1040/MEGA owners. It is MUCH faster, has faster, better disk I/O, many other improvements.

MEGA TOS (TOS 1.02)

This is commonly referred to as MEGA TOS. This version of TOS fixes some minor problems in TOS 1.0 and has support for the BLiTTER chip and Real-Time Clock chip.

Formats: 2 chip ROMs, 6 chip ROMs
Machines: 520ST, 1040ST, Mega 2, Mega 4
Utilities: FOLDRXXX.PRG

FOLDRXXX.PRG is explained above.

Notes: See notes for TOS 1.0.. GET TOS 1.04 TODAY!

Rainbow TOS (TOS 1.04)

TOS 1.04 or Rainbow TOS, as it is commonly known is the latest version of TOS available for 520/1040/MEGA owners. It has been available as a dealer upgrade for awhile now. It has much more robust Disk I/O, Autorunning of GEM programs at boot up, a fix for the 40 folder limit, and much more. Most of all is it much faster than previous versions of the Operating System.

Formats: 2 chip ROMs, 6 chip ROMs (available as Upgrade!)
Machines: Stacy
Utilities: TOS14FIX.PRG, POOLFIX3.PRG, CACHEXXX.PRG, FOLDRXXX.PRG

TOS14FIX.PRG solves some small problems in the AES (for additional information, please see the documentation that accompanies the TOS14FIX.PRG program).

POOLFIX3.PRG fixes a bug in GEMDOS. Documentation that accompanies the POOLFIX3.PRG program explains (in detail) the problem that it fixes.

CACHEXXX.PRG is a new program that adds GEMDOS buffers to your system.
The caching of data and disk directories by GEMDOS (when this program
is
used) will result in your system running much faster! This program is
highly recommended and requires TOS 1.04 or higher for full benefits!

FOLDRXXX.PRG is explained above.

Notes: Please use the utilities available and if you haven't
upgraded
to this version of TOS yet.. please consider doing so. It's a
very worthwhile upgrade.

There are some disk-based versions of _early_ developer only
releases of TOS 1.04 floating around on BBS systems here in
the
United States and abroad. Please don't use them! They are
bad
news! They have some very nasty bugs and have been known to
corrupt data!

STE TOS, Rev 1 (TOS 1.06)

TOS 1.06 is the TOS version that is shipped with the 1040STE and 520STE
machines. It is essentially TOS 1.04 with support for the new hardware
that the STE has.

Formats: 2 chip ROMs
Machines: 520STE, 1040STE
Utilities: STE_FIX.PRG, POOLFIX3.PRG, CACHEXXX.PRG, FOLDRXXX.PRG

STE_FIX fixes the infamous Desktop Medium/Low resolution bug. The
problem is that there is a bug in the desktop code in this version of
TOS that prevents the user from booting into Medium Resolution. The
patch program STE_FIX will solve the problem. Once it is executed in
the AUTO folder, the problem no longer exists.

FOLDRXXX.PRG, CACHEXXX.PRG, and POOLFIX3.PRG are explained above.

Notes: This version is only available in 1040STE and 520STE
machines.
It isn't available for upgrading. It won't work in older
machines.

STE TOS, Rev 2 (TOS 1.62)

This is a slightly revised revision of TOS 1.6. It fixes the POOLFIX
problem in GEMDOS and the problem in the Desktop that was present in
TOS 1.06.

Formats: 2 chip ROMs
Machines: 520STE, 1040STE
Utilities: CACHEXXX.PRG, FOLDRXXX.PRG

CACHEXXX.PRG and FOLDRXXX.PRG are explained above.

Notes: This version is only available in 1040ST and 520STE machines.
It isn't available for upgrading.

Mega STE TOS (TOS 2.05)

TOS 2.05 is the version of TOS currently shipping in the Mega STE.
Formats: 2 chip ROMs
Machines: Mega STE
Utilities: CACHEXXX.PRG, FOLDRXXX.PRG
CACHEXXX.PRG and FOLDRXXX.PRG are explained above.
Notes: This version is only available in the Mega STE. It isn't
available for upgrading.

TT TOS (TOS 3.01)

TOS 3.01 is the version of TOS that originally shipped in the TT030.
Formats: 4 chip ROMs
Machines: TT030
Utilities: CACHEXXX.PRG, FOLDRXXX.PRG

CACHEXXX.PRG and FOLDRXXX.PRG are explained above.

Notes: This version is only avaible in the TT030. It isn't available
for upgrading.

TT TOS (TOS 3.05)

TOS 3.05 is the latest version of TOS currently shipping in the TT030.
Formats: 4 chip ROMs
Machines: TT030
Utilities: CACHEXXX.PRG, FOLDRXXX.PRG, SERPTCH1.PRG

CACHEXXX.PRG and FOLDRXXX.PRG are explained above.

Notes: This version is only avaible in the TT030. It isn't available
for upgrading.

ED> Hi,

ED> I recently zipped some files and copied to floppy, in order to make
ED> more room on my hard drive. yesterday, when I needed to refer to some
ED> of those files, I found that I could not decode them (with the same
ED> program - STZip or ZIP2TOS) and kept getting the error message: "THIS
ED> IS A DAMAGED ZIPFILE OR NOT A ZIPFILE AT ALL!"

You must be having disk problems. STZip is a very solid program.

ED> It also said "USE PKZIPFIX". Does anyone know why I could Zip the
ED> files and yet be unable to unpack them again, using the same program?
ED> Why should they be damaged and what/where is PKZIPFIX?

Pkzipfix is a DOS program that comes with the PC version of Zip.
Phil Katz's Zip. I think what it does is let you recover whatever is left
in a damaged zipfile.

Do you have MROS in the cubase.dat folder? Maybe you could try a newer
version of MROS from Stienberg's website.

From: Kent Johansson <midwinter.removethistoreply@hotmail.com>
Message-ID: <01bdac09$f9393140$6c64a8c0@kent>
Source record: 97362

Howdy.

I once had a Nakasha (I think they where named so) mouse for my ST, I sold it along with a Mega4 some 7-8 years ago, It was the best one I ever had, is it possible to get hold of them nowadays? Any other _good_ quality mouse would also work fine.

I've downloaded a driver that allows me to use a PC mouse, but as it locks up my com-port I don't really fancy it.

Hints anyone?

Regards..

//Kent Johansson

Joakim H&#65533;gberg <I_don&#65533;t_like_spam!@bigfoot.com> wrote:-

>Greetings Atarians!
>
>I&#65533;m looking for a place where I can download ICTARI ISSUE 41, or another
>source that will help me using ICONIFY under GFA.

Oops. -I've been far too busy to deal with the lack of interest
in ICTARI. Anyway, go the the main page at:

http://www.elis.demon.co.uk/ictari/ictari.htm

If it ain't on the main page, then It'll be at the Geocities
site, which has a link. Other than that, try the links to the
FTP sites. -I hope the .ZIP file's not damaged or anything.

What with the recent increase in WEB space at Geocities and DEMON,
I should be able to get more issues onto the WEB sites, but I
made sure that *all* issues are on the 'net somewhere.

I don't have much time to read news right now, for queries about
ICTARI, it's best to mail me. Given the lack of contributions
and my Falcon's sickly disk drive, don't hold your breath waiting
for a new issue.

Have Fun,
"Augeas"

Don't really understand this. Are you saying you merge all .TXT files into one manually?

>>Whenever I import one of these mailes with the weird addresses and
>>then reply to it, Okami uses the weird address in the From: field.

>>postmast@lvdi.net, which is invalid.
>
>Using my method should solve problems mentioned above (and many others
>also).

Okay. I need to think about this and understand it.

>I think so, POPwatch should create one USERNAME.TXT file for each user.
>This file should include all retrieved postings destined for this user.
>The USERNAME must be the same as the name of account (login:) is.

Initial thought on this is *no*. The .TXT should be based on the user in the To: field (or SMTP envelope if using Demon). I am going to have to be *strongly* persuaded by people to change this! The thing you have to remember is POPwatch is *not* designed to work just with Okami. It's designed to be independent.

>I described all this in my mail to Gary a month ago, but with no answer.
>I hope the new version will fix this bug.

This is the main reason I replied to this posting so quickly.
Yes I may have got an email from you (I can't offhand remember, my email
is in Oasis2, but news is now Okami). If I haven't replied then I'm very
sorry. I get a *hell* of a lot of email. If it's dead simple then I try and
reply instantly. If it requires thought then I don't. It has to wait until
I get time to reply. Sorry if it's not quick enough!
I really would like to reply quickly to everyone that emails me, but I
just can't. I have other more important things to do.

BTW, it's *not* a bug. Big difference between a bug, and it just not
doing what you'd like. ;-)

Gary

After I have read a John Whalley's posting, I changed the directory
structure accordingly to his advice.

John Whalley wrote:

>In NOS format, both
>programs expect a standard directory structure, starting with an
>OASIS or NOS directory in the root of the drive:
>
>OASIS-SPOOL-ARTICLES
> -MAIL
> -MQUEUE
> -NEWS
>

To existing directories (MAIL, MQUIE, NEWS) I added directory ARTICLES.
NEWSwatch started retrieving news messages but (it looks) I lost
a possibility of sharing the mail/news folder between PPP and UUCP
versions of OKAMI. NEWSwatch insists to retrieve messages into ARTICLES
directory, OKAMI-UUCP expects them in NEWS directory.
Now I have 2 different databases with news and mail:
one for UUCP, the second for PPP :(((
I am affraid to change the structure of my old existing UUCP database
to adapt it to NEWSwatch's demand.

Source record: 97414

Greetings Atarians!

I wonder what version of COPS is the latest one.
Iï¿½ve seen a 1.08 version mentioned (I think it was on ASH-site
somewhere)
, but I havenï¿½t seen it on the web.

Why am I wondering? Because I think COPS is absolutely the best Xcontrol
clone, apart from the very, very, very annoying fact that I canï¿½t run my
1.07e version after upgrading from 2-->4Mb. Sure I could run Freedom,
but I donï¿½t like it. Itï¿½s much to slow.

/Joakim

s>
s> 3.06 was the last version for Diamond Back and 2.03 for Diamond Edge.

Ahem! B^{)

The Diamond Edge updaters will take your version 1 to the highest v1.x and v2
to the highest v2. Transferring from one version to another (v1 to v2) have
to go back to the distributor - HiSoft in the UK.

Similarly, Diamond Back will update from v3.0x to v3.14 or from v3.5x to
v3.6, but to get from v3.14 to v3.5/3.6 will require you to return to the
distributor again...

d> But I'm always looking for two compatible 32 Mb simms ...
d> Any AixTT experienced user will be welcome for help.

I understand your problem - chosing the right SIMMs was no problem at all in the 30-pin variety, but it became an issue with the Falcon and 72-pin in general.

I'd been using some dodgy SIMMs in my AixTT board (regular screen corruption and failure of one or both SIMMs to be recognised) so when I wanted to upgrade I went to see Dave Encill at Titan Designs, who's been fitting 16Mb SIMMs into Falcons successfully for a long while.

I live close to him, so after ringing him I told him I wanted to bring my TT round and check that the SIMMs operated ok rather than have the problems you've been experiencing.

The first 16Mb SIMM worked first time. The second 16Mb SIMM... also worked first time! I was only going to get one of them, but I didn't want to take them out of the machine B^{)

Contact Dave and see whether he'll either give you the correct specification or sell them to you directly. Whether he can advise you about 32Mb SIMMs or just 16Mb I couldn't say. He's more expensive than PC suppliers, but you'll get the product you want right first time.

r>
r> Are there any clues in this report generated by MagiC's crashdmp.tos
r> utility after Imagecopy crashes?

I can't help you with your memory dump, but could you say what version of Imagecopy you are using? It's best to use the CD version that's higher than v4.0 for best compatibility - I don't think Jeremy spent much time with Magic up to v4, but loads of time with it since.

There's also public beta versions of Imagecopy Plus avavilable to v4CD users on the FaST Club Web site IIRC.

Someone'll correct me if I'm wrong, I'm sure...

by the time you pay for the cable and plugs, and assemble them, you
probably can get them cheaper at Toad. I made a set for myself and
finding flexible wire with that many conductors was the problem.

I am not that good with a soldering iron, and kept having to go back and
redo the connections after moving the equipment around. Finally bought
commercial ones, MUCH more convenient and I am satisfied with them.

You can tell by the copyright dates. I'm not 100% about this, but it should
go like

For an ST

1985=1.0
1985,86=1.02
1985,86,87=1.04
etc...

You should try a program such as sysinfo

Brandon Dove a crit dans le message ...
>How can I tell which TOS version is installed in my 1040ST?

What do you mean it can't compare to the Amiga. As far as the
multitasking? Graphics? Stability? Ease of use? I have both an STe and
an A2000 sitting in the closet. I have used the A2000 about 5 times.
It is a very impressive machine, but the STe has much better software.
I use my Falcon now, so lets not even compare that to the A1200. The
4000 looks like it must have been a monster though:')

Yes. The big problem nowadays is finding a source of TT video cards.
They don't appear to be manufactured any more and many retailers have
no stock left.

I wish some manufacturer/retailer would have a batch of clones made
up. From what I have seen in this newsgroup they would have an instant
market for them.

Maybe I was not specific enough. I don't mean incoming mail, I mean
outgoing. eg. I have a POPwatch beta test list set up in Oasis2, with
various email addresses in it. In Oasis2 all I need to do is send an email
to that list and it goes to all email addresses within it.
Can Okami do this?

Gary

>one for UUCP, the second for PPP :(((

Yes. I had the same problem the other day when I first started using Okami.
Now that I use it instead of Oasis2, I am starting to feel more sympathy
with regards to NEWSwatch's insisting on particular paths. It was never a
problem when using it with Oasis1 and/or NOS. Of course that is what I
designed it for.

>I am affraid to change the structure of my old existing UUCP database
>to adapt it to NEWSwatch's demand.

See you can't have it both ways. If OKAMI-UUCP *demands* news goes in a
directory called NEWS, then *that* is just as bad as NEWSwatch making
'demands'. Sorry, but it is!

AFAIK all you need to do is change the particular line(s) in O.INF to point
to ARTICLES instead of NEWS, rename your existing NEWS folder to ARTICLES,
and voila. I'm fairly sure OKAMI would be flexible enough to allow this?

I am going to change NEWSwatch this weekend, to allow the default paths to
be overridden. When I've done the change I shall make it available ASAP on
my web site, and email it you personally. This new version will be simply to
stop all this confusion. It won't contain KILL file stuff or any of that

because that is still in development.

Regards,
Gary

You can point Okami to the ARTICLES directory. If you're afraid to
move all of your database files to the ARTICLES directory, use a
different *.inf file for news collected with NEWSwatch en start o.prg
with option `-F'.

If you are using MagiC you could make the ARTICLES directory an alias
of your existing NEWS directory so everything ends up in the same
place. Something similar may be possible under MiNT too, but I'm not
sure.

Actually, I built in the address book because people wanted it, but I
almost never use it. What I write mostly are replies/follow-ups, and
you don't need an address book for that, and for the people I mail
regularly and directly, I have an alias.

Mailing lists can be done by aliases, as John explained in another
follow-up to this thread.

Hi Roger,

well, I second Mr. Horseman's statement, got a TC1208 and my standard mode
is 832x608 Truecolor (the card is 32 bit, 24 bit + 8 bpp overlay as they
call it). Also with NVDI 4.12, perfect combo.
The problem would be: there is a market, but how big? 100 pieces, 500 pieces?
At what kinda price? You'll never get one for say USD 150,- I'm afraid.

Look what's happening with RAMboards from Aixit... I ordered a board with 64
Megs beginning of this year. Well, the old ones were all out and at the time
they designed a new one for 256 Megs maximum. So in april Aixit told me the
first batch of 100 was in production. Appearently my order was for the next
production series, but in July I heard they postponed the batch in favour of
production of boards for the Milan... So maybe (I mean MAYBE) I could get a
board around september, october, november, whatever...

Faster chances turning over every garbage belt you'll come across looking
for a dumped Mega STE or TT with a card...

Good luck!

From: brian@tos.pl.net
Message-ID: <Y6KZCJR@tos.pl.net>
Source record: 97439

I have repaired this problem by simply using a thin length of wire from a multi-strand cable and 'sewing' this across the break in the tracks on the mylar. You need to inspect the mylar carefully to determine the problem. The several repairs I have done have all been successful and long term. Also, some thin tape serves as a protection to stop the problem from recurring.
TT030 style keyboards are a particular problem because the case flexes and slowly wears through the tracks on the mylar.

Not quite. Using a text editor ;)

>Initial thought on this is *no*. The .TXT should be based on the user in

>*strongly* persuaded by people to change this! The thing you have to
>remember is POPwatch is *not* designed to work just with Okami. It's
>designed to be independent.

OKAMI keeps a unix server directory/file structure, and unix is a *standard*.
On a server every user has his own "spool/mail/username" file, where
"username" is not a contents of "To:" field but the "login:".
To keep the thread of discussion I used to address a "Cc:" field to myself
in every mail to be send. When retrieving my copies with a POPwatch
I get 10 different *.TXT files instead of 1 file like on unix systems.

>If I haven't replied then I'm very
>sorry. I get a *hell* of a lot of email.

Don't be sorry! I was sure it is the reason :)

>BTW, it's *not* a bug. Big difference between a bug, and it just not
>doing what you'd like. ;-)

Sorry for not being enough precise.
As you noticed, English is not my native language.
At my school I have had 5 hours in a week for 7 years of Russian and only
2 hours in a week for 4 years of English :(

I keep getting this. It appears as though the escape key, along with other
keys at times, are being pressed. The way I've found to get round this is
to open an alert/dialogue box and press return to close it. This has worked
every time so far.

Hi,

I'm designing a low-cost solution to add an Ethernet interface to a VME bus. Since this might be handy for the Atari community, I'm asking your help.

Could anyone give pointers to info on VME buses in general, and the Riebl cards ? I have asked this before, but the links I got were 'future' or on some gargantuan homepage where one gets lost in an eye-blink.

Any info is great, but I'm looking for bus timimg cycles, data flow charts, etc. Electrical schemes are also great, if accompanied by sufficient comments.

Thank you,

Now that sounds interesting! Not that I've managed to run out of RAM
yet in version 1.2. Is it an expensive upgrade in Germany?

I haven't managed to get it to connect at greater than 19200 yet (on a 300MHz PII): is this normal and if not do you know of any tips for getting the speed up? I have a 56k modem, which is a little wasted at 19200.

TIA

Roger Cain wrote:

> Ah yes! Found it! Do I HAVE to run AVSERVER to use this or can I just
> nominate MAGXDESK as the AVSERVER?

I begin to get confused with this thread ;-)

I'll try to sum up:

I use Magxdesk as my... desktop, with avserver.app to expand its AV
features, and with the env variable #_ENV AVSERVER=AVSERVER in magx.inf.
For the fontselector problem, I have the env variable
#_ENV FONTSELECT=AVSERVER in magx.inf.

A-man is finaly just there to add some more AV features.

Bye,
/Pascal/

Make sure you have maximum logging turned on, for all configs.
Octopus is usually very good at telling you why it won't boot.

I used a Best Mouse for years that I thought was almost perfect.
Eventually, the buttons gave out, so I had to replace it. I bought a
Wizard 560 (DPI) from Systems For Tomorrow and I like it even better!
It's not quite as ergonomic as the Best Mouse, but the 560 DPI is
very nice, eliminating any need for a software mouse accellerator.
And the buttons with tactile switches are much, much better than the
Best Mouse. Give them a yell at sales@SystemsForTomorrow.com.

Ok. I've tried running the ALIAS.TTP and it just bombs with an exception
error. This is under MagiC5.11 and MagxDesk3.21. Anyone else have this
problem?

>Oh well, I just delete 'em...

Having read the posts in this thread, it seems that you are all
misunderstanding the use of the kill file, and rejecting email. :(

To reject an email it must have a return address that the rejection can be
sent to. Some SPAM does not have one, so it cannot be rejected!

The Kill File processing of POPwatch is not the same thing at all!
You can manually add details to the kill file, by selecting a piece of spam,
and using 'Add to Kill file' menu option. Then manually delete said spam.
Next time you connect to your POP3 server and PW downloads the list of
waiting email, it will check each one against the Kill file. If a match is
found then that email will be flagged with a K, a bell will sound, and the
email is shown in red. Now you can 'unkill' at this stage by taking the
'undelete' menu option. When you disconnect from the server the following
will happen for any 'killed' emails:
a) If set to send a rejection upon killing then it will send one.
b) Regardless of whether the rejection worked, the email will be deleted!

Rejection though nice, is not essential to using the Kill file. They are
linked, in that if you 'reject' an email then it can be automatically added
to the Kill file, so next time any mathcing email is automatically killed,
with no need for rejection.

Hope this clarifies things. You don't need to be able to REJECT to use the
KILL function of POPwatch.

Regards,
Gary

>Buy a Milan. The board will run faster on the Milan than the TT030.
^^^^

Raymond,

Get real, dude!

People won't start dumping their TT just because the Milan came out.
All we need is a (choose one: graphics, TT-ram, Ethernet) card to
make our TTs a happening machine again.

Besides, it ain't too difficult to produce the necessary hardware.
In fact, all it takes is getting the production tooling out of the
closet and we'll have a fresh batch of Crazydots-2 and Riebl cards
ready to upgrade our TTs and Mega-STEs.

The question remains:

who will be the brave soul to purchase the tooling and commit to
another fresh batch of those cards?

Also, notice the Milan isn't quite shipping yet, nor are many drivers
written to support all that great PC hardware at this point.

"Will run faster" still means future conditional. It ain't there yet.

Those are the facts.

I guess I'm gonna have to get an FPU and and another Jazz cartridge so
I can install Linux. Does anyone know if the F030 vers. of linux
utilizes the DSP. It's a shame more applications don't use the DSP
chip. I got a 32mhz chip in my computer that gets no use. After some
of the things I've seen programmers do with a 16 color 8mhz ST, It
would be amazing what they could do with a machine 4 times as
powerful. I am still amazed at Photochrome3 on my STe, and the 50hz
mod player.......the list goes on and on......at least we still have
some of the best utilities available on any platform.

B.P.

Ah yes! Found it! Do I HAVE to run AVSERVER to use this or can I just
nominate MAGXDESK as the AVSERVER?

Imagecopy does. There are probably quite a few more - try LOOKNSEE,
SMURF etc.

What type of adventure game. I would love to see an old SSI type Phantasie, Demon's Winter, Wizards Crown type game that took advantages of at least all the capabilities of the ST with expanded graphics for the TT and F030. I loved playing those games back when I had my C=64:')

I'm still very new to it (only had the PC and MagiC PC for a week),
but so far it seems pretty good, though it's more choosy about
software than MagiC on the STE. Mostly due to extended graphics
modes, eg both TruPuint and TruImage won't work in more than 256
colours: TruPaint locks the whole (MagiC) system up if you try more
(and I've yet to discover a way to access the MagiC program manager
as every time you press the ESC when trying to do CTRL-ALT-ESC the
Win95 start menu appears). TruImage complains about not being able to
map the palette or something at which point I've chickened out of
proceeding though the toolbar appears. As neither program was
entirely happy under MagiC on my STE I'm not particularly surprised
at this, though. Imagecopy won't let me select a transparent colour
for a GIF either (I get little error messages at the top of the
screen).

Calamus SL, Papyrus, Everest, 1stGuide, and CAB (2.5) are fine so
far. The main Okami reader seems fine, though I haven't yet tried the
TTPs. I've had no luck so far with STinG: it dials and connects OK
but when you try to use CAB it grinds to a halt. Same with I-conn so
I suspect I've not got the settings right for the serial port yet. I
certainly haven't given up hope, and have yet to try any other
clients anyway. I can't help you WRT Devpac, unfortunately.

The only major quirk I've uncovered so far is that file/folder
aliases don't work on mapped Windows drives, only on drive
containers.

Otherwise, running full screen (so no hint of Windows) at 1024*768 in
large numbers of colours is pretty wonderful compared to ST-Hi,
though as a Falcon user you won't find it to be such a revelation.

BTW don't even contemplate buying MagiC PC without NVDI PC, or you'll
be limited to 16 colours, and it's also worth noting that it's
limited to 14Mb of memory like the Falcon (presumably for similar
reasons to do with memory addressing), so the rest of your PC's RAM
isn't going to be used.

Have you ever used MagiC before? If so and you liked it
you'll love it. It's very fast compared to other ST emulators.
If you pay the extra money and get NVDI PC then you can run
True Color custom video modes independant of what your PC
is doing. MagiC pC can also run ST TOS Images to play
ST games with sound. I don't know about Sting and the other
program you listed but I can run CAB 2.5 with their I-Connect
program and hit the Web if I care to. Try hitting the ASH
web site and download the demo of MagiC PC. It's in German
but pretty easy to figure out. I own Gemulator also and
use MagiC PC almost all the time now. I've yet to get the
newest Gemulator Ver 5.X I'm at ver 4.5. MagiC PC runs
Magic best and Gemulator runs TOS best. Gemulator claims
to run MagiC but the outcome is not real pretty under Ver 4.5.
Another option is TOSBOX. I tried that about 6-8 months
ago when it was still a little rough but it did a good
job of running serious programs. If you can not get the
demo of MagiC PC I can E-mail it to you.

Just tried it under MagiC PC and I have the same problem. Thinking
about it, the last time I used it was probably with Okami 1.33 so
maybe there is a problem with this version.

Anyone else had problems?

I've had a further play and seem to be able to get a working
connection at 19200 but if I up it to 38k everything slows to a
crawl/stops altogether :-(

(This was tested with CAB and POPwatch looking at the contents of my
mailbox.)

I have a vague recollection of some STinG users having similar
problems with real Atari kit so has anyone got any ideas as to why it
happens and are there any workarounds?

2576. The 9th Adventurer`s Convention

Newsgroup: comp.sys.atari.st
Date: 1998-07-11 00:00:00 UTC
From: Larry Horsfield <Alaric@larryhorsfield.demon.co.uk>
Message-ID: <LwEmFQA8j2p1Ewmu@larryhorsfield.demon.co.uk>
Source record: 97313

Hello all in Comp.Sys.Atari.ST.

If you haven`t already heard about it, you may be interested to hear about the 1998 Adventurers Convention, which is being held in Birmingham (UK) this coming October, as it has been for the last 8 years.

The Convention is being held on Saturday, 24th October 1998, in the Ariel Suite of the Royal Angus Thistle Hotel, St. Chad`s, Birmingham B4, which is at the end of the A38M and easy to get to from all parts of the country.

The Convention runs from 9am to around 6pm and covers all formats from Spectrums to PC`s. Tables are available if you wish to bring along your own computer(s) and we actively encourage this as we depend on those attending to bring their computers, so the more the merrier! If you wish to bring hardware and/or software to sell you are more than welcome to, but no pirated software please!

The event attracts adventure enthusiasts from all over the UK, including Northern Ireland, and the atmosphere is very friendly and informal. Many of us stay overnight at the hotel and the evenings can be just as lively and interesting as the convention itself! We have yet to welcome anyone from outside the UK to the Convention, but we live in hope!

During the day we have the popular "Megapoints" competition running. In this the contestants get 20 minutes playing time at a specially written Spectrum text adventure, with the object of scoring as many points as possible in the alloted time. There are usually cash prizes and special certificates for the 3 highest scores. The adventure this year is being written by Ulsterman Jon Scott, author of various Spectrum text adventures published by Zenobi Software.

Tickets are available now and cost 6 ukp per person if you buy yours before 31st August, 1998. Thereafter, or if you pay on the door on the day, the price will be 7 ukp per person. Tickets may be purchased from:

Vicky Jackson, 128 Merton Hall Road, Wimbledon, London, SW19 3PZ

Please make cheques/PO`s payable to V. Jackson

* * * * * * * *

HOTEL ACCOMMODATION:

The Royal Angus Thistle Hotel has special room rates for those attending the Convention. These include full English breakfast and are as follows:

Single Room: 37.50 ukp per night.

Double/Twin: 32.50 per person, per night.

Please contact the hotel to book your accommodation, NOT the convention organisers. The address and phone number are:

Royal Angus Thistle Hotel, St.Chad`s, Queensway, Birmingham, B4 6HY

Telephone: 0121-236-4211

Don`t forget to inform the hotel you are attending the Adventurers Convention, otherwise you will be charged the normal room rates!

NOTE: The Convention is on the weekend before the start of the Birmingham Motor Show at the NEC. Whilst the hotel have promised to reserve a number of rooms for us, you are strongly advised to book your accommodation AS EARLY AS POSSIBLE to avoid disappointment.

If you have any queries about the Convention, or would like to reserve tables for your hard/software, please contact me at the email address below.

Hope to see you in Brum in October!

Larry Horsfield

I believe they were built by a company called IB Computers formerly
located in Washington State. They sold them to people who needed
access to the 5 1/4 inch format to read data off IBM Compatible 360K
drive disks. Not sure how any sold, but you see them selling cheap
from time to time.

I think you are wrong. NVDI 5 works with the complete Stylus range of
inkjet printers, also those Windows printers.

It is a web based outfit that is running a list server, I don't
know the full number of lists they are running, but I am on at
lest 5 or 6 lists that are running from onelist.com.

Bummer.

>The Kill File processing of POPwatch is not the same thing at all!
>You can manually add details to the kill file, by selecting a piece of spam,
>and using 'Add to Kill file' menu option.

Okay, this, and the difference between Rejecting and Killing are
understood.

However, a lot of spammers are using mass emailers that cobble up a
fake address in either the From: or To: fields (or both) that is
different every time they send out the message. For instance I get a
lot of spam from someone at earthlink.com, but the user id portion of
the addresses is usually a number, like 90645@earthlink.com. The next
time it'll be 80636@earthlink.com, and so on.

Most of the addresses in my Kill File have only occured once, and as
such are useless for killing any spam that arrives later.

Would it be possible to modify the Kill function so that I could enter
*@earthlink.com, so that ANY emails from this domain would be nuked?
(I can always UNDO the deed if I decide I would like to receive it.)

Popwatch is a very useful item for screening mails, and I have used it
from its first release. But the presence of the Kill function is so
tantalizing, it would be nice if it were to be expanded so as to short
circuit those devilishly clever spammers.

d> to my atari falcon?? I've tried ghost link but cant see to get it
d> going and Parcp needs a special cord that i cant seem to
d> find...is there any other way to do it??????

Parcp's lead is very easily made, the instructions are there in the archive.

I bought a lead from a PC Fair and opened the shell of one of the connectors
to make the necessary crossovers. Make sure you get a lead with plugs at each
end - and that the shells aren't moulded! :-))

Speak to 'ya later!

Hello!

I am in the process of learning the M6809, which some instructions
were carried over to the 68000.

SInce I also have a 1040STF w/30 MB HD, I would like to start to
program the 1040STF. I have the Mark Williams C, and the Gem
Programmer's Reference. But, I would like some more.

UNFORTUANETLY, it seems that I got robbed with an internet deal to buy
some 27 ST mags. (I was hoping that they might contain some
programming info) :(

Anyone have the needed info? Articles, newletters? SOurce code?
Examples? I would be willing to pay shipping.

US users please.

Regards,

Jim

Hi STeve,

I found Octopus on the web and downloaded it. I'm currently trying to learn how to configure it, thought I had it all figured out (well, mostly figured out), made a bunch of changes to the file areas and message areas CFG files, tried to boot Octopus and it would come up and then immediately shut back down again.

Guess I'm gonna have to be more careful in configuration. I sorta wish it was better at generating an error list and telling me why it failed, instead of just dumping back to the desktop without any explanation.

In any event, I've been unable to find Semper. I'm currently running FSERIAL to speed up the ports, and its doing a good job, but everybody here recommended Semper.

Any ideas where I could find that for download?

Thanks.

How about running in TT high resolution? You'll need a monitor that can handle it, and of course its monochrome, but at least its a nice high resolution.

I saw in the Systems For Tomorrow catalog they have such a monitor (Part # 11052) for $299.

I also saw that they have some kind of VME video card, all it says is that it does 800x600x16. Not that great, but it's only $25.

Might want to give them a call... 800-875-4943 or email to: sales@SystemsForTomorrow.com

Hope that helps.

Hey Scott,

the best (if you have access to the Net already) is go to
http://www.flinny.demon.co.uk/download.html
and fetch what you need: CAB 1.5, Sting, CAB-OVL, TelVT102 (telnet),
AtariIRC (IRC), Finger, and HSMODA7.

You need that one, since even with TOS 4.x (Falcon TOS) Atari never bothered
to get the ports done right. There's extensive docs, and for every machine
there's patches to get the ports at least do what they're supposed to do.
So HSModa is a set of prgs, ttps, docs etc. to fix up your serial ports.

CAB 1.5 was "free", the later updates are commercial packages.

Newsie (now at 0.90) can be fetched from
www.primenet.com/~rojewski/newsie.html

There were some problems with the prg from a belgian ftp site, but this URL
is perfect. (Hey, I registered in about 1 hour, tks John!)

Hi Kent,

if you want MT on your Atari, you need Geneva, MagiC, N.AES/MINT or
something else. MROS was only to get Cubase up and running from TOS.

Don't expect to get a general MT environment on Atari from it :-(
It was good enough to get Cubase running though :-)

Try to find STemulator -- somewhere on www.atari.de, or
www.atari.dee/falkeverlag. It costs less that 100 DM, what is about 60 $ or
less. There you can find a demo version.
I use it in P200, 32 MB, and it is good. Of course, it is not so fast as
PC, but it is faster than a hardware Atari...
(I work with Calamus by PaCifiST, Signum!2 by STemulator, etc.)

Yes it is. Under the menu 'Messages', click on 'Add to kill file', then
enter 'earthlink.com' into 'From:'. Finally click add or press return and
all incoming mail from earthlink is killed. This can be repeated for any
domain as required.

You may also try *zip_rbld.prg and zipsplit.prg*

That's is what the docs says about it:

The aim of ZIP-Split and ZIP-Rebuild is to recover ZIP files for
which ones ST-ZIP says that they are "damaged or not a ZIP file at
all".....................

These programs can be found on the most Atari ftp-sites I guess.
It's certainly on the Belgian site but I can't remember me the exact path.

193.190.205.13/atari maybe in the incoming dir. Look for *zipsplit.zip*

If you're unable to locate it, mail me and I'll send it to you (Base64 or
UUencoded)

I have an Atari 1040 STE in perfect working order except the disk drive which fails to respond. It is boxed as new with all manuals and education/start up disks instructions and there are a couple of games. Im selling it for £30 UK pounds plus postage and packaging
Anyone interested reply to me loonie@globalnet.co.uk

2608. new SCSI Superdisk, other Comdex news!

Newsgroup: comp.sys.atari.st
Date: 1998-07-11 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <35a6b15a.0@diana.idirect.com>
Source record: 97366

well, I spent much of today over at Comdex Canada in Toronto, and I have some interesting news and experiences to share:

- another company is now making a SCSI version of the Superdisk! Winstation, a US company, is making an LS-120 compatible SCSI drive available called the SLS-120: it comes in an external version and in both 3.5" and 5.5" versions for internal mounting in a tower case. I guess Uwe Seimet should be getting together the next HD Driver to work with this version....

- I talked with a salesman from Epson Canada and he was delighted to hear about how well Epsons work with Ataris, and especially about the letter writer in the last issue of Atari Computing who said he got the Epson 400 running with his. He was quite intrigued and wanted to learn more. BTW, there's now an Epson 300 model available, and a new Epson printer that will print directly from an Epson digital camera...

- ran into Darek Mihocka and saw his new version of GEMulator, which now runs both Atari and Macintosh on the PC. He'll be at tomorrow's TAF flea market as well.

Lots of other booths where I dropped off my business cards in the hopes of winning a PalmPilot :)

Use a program called MacSee, I had purchased it a number of years ago
trying to obtain some fonts from a CD-ROM I had purchase that was
suppost to be Type Ones & True Type, only to open it and find I
couldn't get but True Types on a IBM readable format, the Type Ones
where stored in Mac Format. I think I've since seen it listed now as
Shareware, but forget the ftp site I found it at now.

Not sure if it will work on a Falcon, I know the Falcons when they
first came out had some compatiblity problems with the cartridage port
and scanners. Should be a max of 400 DPI scan, I'd try it in
monochrome mode (640x400x2) (ST High)..

I would have to agree with everything you just said. My KILL file is growing larger, and REJECT has never worked for me. And I do notice that a lot of the SPAM I get is from the same server, with slightly different names. Sure, I can manually delete the SPAM, and that's what I do, but I like your idea.

2617. Epson Printers

Does anyone here have experience using the Epson Stylus Color 600 printer with their Atari?

I am thinking about gettting one, and just wondered if there are drivers for it (for NVDI and PageStream).

Also, anything good or bad to say about it?

The cheapest I've found it is for around $180, which seems like a good price to me - although the Stylus Color 400 is $50 cheaper than that, but not as high in the D.P.I. department.

Thanks!

I tried to download what appears to be version 90 of Newsie from that Belgium FTP site that is often mentioned here (I forgot the address at the moment). Anyway, it was a ZIP file, and I tried downloading it twice just to be sure, but both times when I tried to un-ZIP it, I got an error message "not enough memory" - which is hardly true on my 14 meg Falcon. It's not a very big file, so I'm guessing it's corrupted or something.

Anyone else try this ZIP file?

>Is there a viewer for the Falcon that displays Windows bitmap (.BMP)
>pictures?

Sure. 1) Imagecopy v4: Commercial. More info http://www.cix.co.uk/~sta/
2) Gemview 3.16: Shareware. Unregistrated version can be found on
almost every Atari ftp site. I don't know if it's still
supported. Look for *gview316.zip*
3) Graftool: Registerware: One must send the author a mail in order
to get the registration key. Also available on every well sorted
Atari ftp-site. Look for *gt970907.lzh*
4) Stella 2.62: This is what the docs says about it:
This is version 2.62 of STELLA, a document database program. If
you have many CD-ROMs full of clip arts or pictures than STELLA
is just the right thing for you to handle your files... If
STELLA knows the format of the file, STELLA will produce small
preview images that make browsing through your database quite
easy. The records may include a description of the file and as
many keywords as you chose. A complex search engine wil help you
find the needed data easily. And, STELLA knows a lot of graphics
file formats popular under TOS, Windows, Unix, so it wil as well
serve as a picture viewer. Right now the program and its
documentation is in German but that might change. STELLA is
shareware.
Look for *stlla261.lzh*

Message-ID: <900150525.29940.1.rover.c3adfca1@news.demon.nl>
Source record: 97387

Hi,

I believe it was Paul Nurminen asking about programs reading BMP files on a
Falcon...

I believe Gemview will, Graftool definitely handles BMP. I'd opt for
Graftool since it's faster and still supported.

Hi Raymond,

oh yeah, I know a few more:

Buy a P-800 with 512 Megs.... the RAM's cheaper, machine's faster...

Buy a Milan-060, it's faster than a 040...

Look, I've got this TT with "only" 20 Megs, so I need more. Pay USD 350 for
a new board with 64 Megs, right? Heck, that's one price these days for a
bloody RAM upgrade, but I don't want to invest in a PeeCee because that'll
mean invest every 2 weeks to keep up.

Next year I hope to be able to choose from a Milan-060 or Phenix-060,
probably with 128 Megs (maybe more) and the TT won't be sold but will stay
here as a back-up system. I need more RAM NOW and there ain't a Milan-060,
let alone a Phenix... Besides, what good is the Milan right now? No MagiC
available, some drivers not available. The same will go for the Phenix when
it eventually sees the morning light, and I sure hope it will.

Well, maybe I should have a look at a Hades-060. At least MagiC is ready for
that one... :-)

2632. MagiC PC - any good?

Newsgroup: comp.sys.atari.st
Date: 1998-07-11 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <35a73ee42ac070@the-gap.demon.co.uk>
Source record: 97390

I'm currently thinking of moving to Florida for a year, and of course that would mean I'd be Falconless and unable to support any of my software.

Once there I would probably buy a laptop PC (useful for work etc.). But I'd like to be able to continue to support my Atari stuff.

So how good is MagiC PC? Is it a viable alternative to buying a real Atari out there? Could I run Devpac3 and STinG?

Thanks for any help,
Gary

IIRC it can already do this, just edit your KILL.TXT and add a line
saying:

T earthlink

Any messages with earthlink in their To: fields will be deleted.

POPwatch's kill file assumes that the entered phrase/word might be
found anywhere in the relevant line.

Epson Stylus Color 400 can't work properly with Atari.
It supports only some ESC P codes (Epson Standard Codes for Printers)
and works mainly in a graphic mode with ESC P2 commands set.
I use this printer with a PC and couldn't find any drivers for Atari.
As I know, Stylus Color 600 supports both standards.

HS> Is it adequate to ensure that the CPX is set as "Resident"?

Not even that, all you need do is to set and save your settings in the CPX,
and as long as the CPX header is loaded (ie you can see its title in the CPX
loader - COPS or whatever - then the settings will be in force.

You only need to load the CPX itself if you want to CHANGE the settings.

If there is someone who is experienced in installing these cards it would be
best to get them to do it for you, some Falcons can be tricky!

Titan have the installation manual for download from their web site if you
can get someone to grab it for you so you can see what's involved.

2644. Atari ST520 system for sale.

Newsgroup: comp.sys.atari.st
Date: 1998-07-12 00:00:00 UTC
From: kgroombr@interquest.de
Message-ID: <19980712.A202958.12519@amiga.interquest.de>
Source record: 97152
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy

I recently aquired an Atari ST520 system is barely used. I received
it in a trade and thought I could use it, but really can't.

Here is what I have got:

Atari 520ST
Atari Megafile 60 hard drive expansion unit
Atari SC1224 color monitor
Atari SM124 black and white monitor
Atari SMM804 printer

I have all cables and such to connect this all together.
Currently the Megafile 60 and the SM124 monitor are labeled
for 220v European power, but for all I know it is an easy
conversion to get it to run on 120v. If not, transformers
are available to make these run on 110 power. I have some
but they will cost extra to ship with this.

I have absolutely no idea what this stuff is worth if anything,
but I am willing to accept offers or trades for PC and
Amiga stuff.

Everything is in perfect near new condition. I am in the
military in Europe, so I can ship to a U.S. or European address.

Hi Ted

seems like your getting noise on the DMA line, you can check this if you are using an ext SCSI HDD by running the TREE_CHK.PRG program that normally ships with Kobold, if your DMA line is noisy then it will show up as hits (error counts). One solution is to re-route the white wire from the buffer away from the memory pack, alternatively you can screen it by replacing the white wire with a screened cable but only earth one end I would suggest the buffer end.

Regards

Mick Lock

> asking your help.

I don't know if this is really what the Atari community needs. Not every
Atari computer has a VME bus. That's why I think an Ethernet interface
to a SCSI bus would be interesting. Every Atari computer would be able
to have Ethernet that way (for ST's with Link off course).
Don't forget there allready exist Riebl cards for the VME bus and there
is also a do-it-self package available to build your own VME ethernet
interface based on the SMC ELITE ULTRA card. You can download the
package here :
ftp://193.190.205.13/Atari/Network/VME/smc_tt1.zip
or thry the link on thi page :
http://www.eikon.e-technik.tu-muenchen.de/hardware/atari/atariether/
If you understand German I don't think it will be a problem. BTW check
first if you still can get SMC ELITE ULTRA card, if you would use
this...
Hope this helps,

Greetings

Hi Neil,
I run MagiC4/Ease4 on both my falcon and my TT. Ease is run as a
shell for MagiC. I would love for my windows to refresh automatically
but I must hit the escape key (manual refresh). After seeing your
post, I looked in the Options menu of Ease and found the "refresh
windows automaticaly" selection (Window 1 settings), but it was
greyed out, and the box was selected. Being as it was greyed out, I'm
not able to select or deselect it.

How are you getting ease to do this? Or are you referring to running
ease under TOS as opposed to Ease w/MagiC?

Thanks,
Mark Simpson

2653. Re: NOS Kill file format (was Re: Okami 1.34)

Newsgroup: comp.sys.atari.st
Date: 1998-07-12 00:00:00 UTC
From: outrider@lvdi.net
Message-ID: <35a8c406250c3cd2@lvdi.net>
Source record: 97161

On Sun 12-07-98 18:36, Gary Priest scribbled:

>Ok. Here is the description of the NOS kill file format, that I am proposing
>to implement in NEWSwatch. Any comments?

It looks pretty good to me.

>The actual Lines: example will not be relevant with NEWSwatch, because I
>have implemented that separately from the KILL file. It's actually a
>seperate preference, as is 'number of crossposting groups'.

Will we be able to have separate settings for Lines and Number of
Crossposting Groups, for each individual group? If not, consider
this a request. :^)

>Also I plan to have NEWSwatch keep the headers of killed articles, or
>totally ignore them depending upon another configurable preference.

That is good. I'll probably usually have it ignore them, but might
take a look-see occasionally to see if I'm missing anything important.

The shell window refresh is not automatic. It is said in the compendium (or every else developper documentation) that the application which had modified something on the disk should call the desk with APPL_WRITE (SH_WDRAW=72 with the drive's id). When the desk is called, it will refresh all window corresponding to the drive.

Tis there not a desk problem but some coders laziness.

2659. Re: Ethernet & VME

Newsgroup: comp.sys.atari.st
Date: 1998-07-12 00:00:00 UTC
From: Fourth Horseman <horseman@xmission.com>
Message-ID: <6obh64$8kf$1@news.xmission.com>
Source record: 97167

Dayna Communications use to have a cool little gadget for the Macintosh that would plug into the SCSI port and provide an ethernet interface. It was really slick, and plenty fast.

I wonder if something like that couldn't be worked up for Atari machines. Quite honestly, a VME solution wouldn't work for me because I'd have to lose my video card (which I'm loathe to do -- go back to 640x480x16... not on your life!).

I wonder how difficult such a SCSI/ACSI --> Ethernet interface would be to build. I would think writing drivers would be the hard part.

Plus, with no TCP/IP built into the OS you've got to use an add-on layer like STiK or something.

Hi, Mark

You need to run the bundled changes.prg to enable automatic window updates in Ease 4. Install it from the auto folder or desktop and Ease will make that function available (it won't be greyed out).

Note that you'll get different 'refresh' results depending on the actual program saving the file. Like writing a new file, some programs will refresh the background directory but the file will show as 0 bytes; other programs will do a complete 'refresh' (filesize and timestamp).

Source record: 97170

I must not have been clear in what I was saying.

The ENGL_BR.MLX dictionary you have from Papyrus 5.15; it is
British not American. No American dictionary came with Papyrus 5.15.

You can load the DIC dictionaries into the Spellchecker but the old DIC
files are not intergrated for use by Papyrus 5.15.

Only a TXT file changed to a TLX is used by Papyrus 5.15 and only in
conjuction with a loaded MLX.

Resaving a DIC does not make it usable in Papyrus 5.15.

The bottom line is you can not use the old DIC dictionaries with Papyrus
5.15

The real purpose of my thread was to get the USA Atari user's of Papyrus
5.15 to send in request for an American dictionary from HiSoft.

The lack of support of an American dictionary or even the ability to use
the older dictionary files in Papyrus 5.15 for American user's is piss
poor support and a total disrespect to the American users.

I had the same experience a 10 years back when I upgraded to 1st Word
Plus. Seems they (yes HiSoft did this too) did not send out an American
dictionary with the American upgrades for 1st Word Plus. I was in graduate
school at the time and had several papers down graded for spelling errors.
Spelling errors in which I found out latter due to using a British Spelling
dictionary with my word processor (The damn thing flag the word baseball
in a spellcheck). I am soon to go back to graduate school. I do not intend
to go through the seem problem again from the same company which is suppose
to be providing correct support for their product.

HI all

Spin for magic is ment to go in the extension folder not the auto

set up is Spin will start with magic as it is a file extension as well. The C:\GEMSYS\MAGIC\XTENSION\DEV_FPRN.DEV is also ment to go in there as well.

C:\GEMSYS\MAGIC\XTENSION\SPINMAGC.XFS

C:\AUTO\SPIN_SD.BOS
C:\AUTO\ISO9660F.DOS
C:\AUTO\CONFIG.SYS
C:\AUTO\METADOS.PRX
C:\AUTO\METAXBS.PRX

My set up is to run Magic and magtorom first before xboot starts spin also starts at the same time.

Metados or metaxbs does not have to be enabled as spin will load metaebs.
Regards

well, I have the original letter here in front of me from Peter
Wood in the UK. Apparently he's gotten it to work with Imagecopy,
Positive Image and First Word - he used EPSON_MT.CFG as his driver in
the latter.

I know how you feel about getting a bum printer - I originally got
a Canon BJC240 and found out that I couldn't switch from black and white
to colour mode because Canon took out the dip switches (@#$%^&*). And
the company I bought it from wouldn't take it back because I had used it!
I finally was able to make a trade at another shop for a slightly used
HP DeskJet 540 that so far has proven itself nicely as a workhorse
printer, though I'd like to get one of the newer ones or one of the
Epsons....

Yes, I've got a large (and growing) kill file, and I know you don't have
to reject e-mail in order to kill it. My point was that often, the
spammers send mail from the same server, with _many_ different "user
names", therefore, the mail isn't killed because the address is slightly
different than what's stored in my kill file list. I've gotten about 15
junk mails from the same server (often similar subjects), but never the
same "user name". See what I mean? Anyway, it's not a big deal really.

2675. Mags,Expose,aFTP,MagiC!

Newsgroup: comp.sys.atari.st
Date: 1998-07-12 00:00:00 UTC
From: collins@bulli.com
Message-ID: <6o9ip9$g3@priv-sys04-le0.telusplanet.net>
Source record: 97211

I have app. 80 atari magazines, including everything from Antic
Magazine to ST Format. Date ranges all the way from 1986 to 1995..
So, anyone want them? I dont want any money from them, but I would
like to get a second mouse out of the deal! It doesnt even have to
be an atari mouse, Even a nice second hand serial mouse I'd be happy
with.. (I installed Serial 1 on the falcon).
I am located in Alberta, Canada so it would be best if you were close
as the box weighs quite a bit..
And if you really want the magazines (or need them) but have nothing
to give in return thats ok too, just email me and we'll talk :)

--Ok Next subject--

I really really want an Expose Digitzer but I have been told they
were not made anymore, does anyone have one for sale or know where I
can get it? I am willing to give a 4 meg STE/400meg hardrive/2 monitors/
handscanner/ etc etc in hopes that will bring the price of expose down
a bit.. so... anyone? :)

--And finally the last issue--

As some of you may know I have made a MagiC support site, but unfortunatly
It is not everything I want it to be. This has nothing to do with me, the
problem I have is that I have no more web space! :(I have an extremely
updated
version of the page (over 50 magic-specific apps! Snaps and info about MagiC
6,Cab 2.7 etc etc) but have no where to upload it
to!
I was thinking about Geocities, But they are usualy slow and I wonder
How hard it is to uplad to your webpage? Do you have to go through the
web to upload or what? How does that work? I once tried to register with
them there with no luck, I must be dumb because I got lost in the
registration process...
Another option I am considering is atari.de. I *think* it says that they
provide free webspace to atari-related pages???? Does anyone know if this
is true? as my german is not so good!

Speaking of MagiC, i recently discovered 2 new MagiC apps. The first called
"MagiClogin" which is by the same guy who did FIFFI. It is indeed a very
useful program and a nice addition to the magiC apps page.
The second program is a Telnet program for Iconnect called "Teli"
and It is again made by the same guy. Now already there are *2* telnet
clients for iconnect..
we just need a IRC client now..(Although I talked to fraccy awhile ago
he said he was considering making it compatable with Iconnect)
--

Oh wait, I just thought of something else!-
--
Ive been following the discussion about aFTP lately,
And I have had bad results too. Ever since the latest version
for StiK it bombs when it try's to connect to some hosts :-(
--
And 1 more thing..
--
ABout the 2 magic Mailing lists. This could be good and it could be bad.
It could be bad if the 2 mailing lists both send out the exact news to
everyone on the list in different words. Those (like myself) who
would subscribe to both would get tired of reading everything twice.
It would be good in the sense that if 1 list missed something the other one
would (hopefully) not miss it. I am just happy that MagiC is finally
getting some of the support it deserves.!

Ok, well I can see many people yelling at me for making this Post so long
and containing so many different topics in one email, so sorry in advance!
I dont post messages here very often so when I do I want to cover everything :)

Bye, if you have any problems concerning MagiC please email me and im sure
I can help.

2677. Silly Sozobon C Question

Newsgroup: comp.sys.atari.st
Date: 1998-07-12 00:00:00 UTC
From: Russell Magee <bigruss@cheetah.spots.ab.ca>
Message-ID: <6o9pgj$bq7$1@f02s02.tac.net>
Source record: 97213
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi all,

I've been getting familiar with SozobonX (v2.05) on my TT/030 and I'm
getting wierd behaviour with the fwrite() function. For example:

```
#include <stdio.h>
#include <stdlib.h>
#include <fcntl.h>

char test[32] = "Some test data";
FILE *outfile;

int main(int argc, char *argv[])
{

outfile = fopen("foo.dat", "w");
fwrite(test, 32, 1, outfile);
fclose(outfile);
}
```

(error checking etc. omitted for simplicity)

Now if I look at the data actually written out, it's not at all what
it should be.
I'm reasonably proficient in C, but am I missing something here or is
it a known problem (buggy lib etc.)

Thanks in advance,
-Russ Magee

| . . .

I have been using a Naksha for years, certainly long after other mice gave up the ghost. It seems to be the microswitches which fade and unfortunately I think this one is starting go. System Solutions sold, and perhaps still sell, a mouse which is identical in appearance (except for the logo) but which seems to have inferior switches. I intend taking one of the failed ones apart and seeing if it is possible to change the switches.

I fully agree with you. A month ago I had to replace my Logitech mouse so
I bought me a 560 DPI Wizard mouse. This is definitely a very good mouse
(not so good as the Logitech mouse IMHO). Due it's high resolution one
doesn't need a mouse accellerator at all.

16/32 Systems (England) is also selling this type of mouse

Yes, there is. Something freakish must have happened when I recompiled
everything for version 1.34, because nothing was changed in the alias
program. I recompiled it again, and now everything is fine (here, at
least).

For those who still have it, use alias.ttp from the 1.33 distribution.
Gary and Terry, I will send you the fixed program by email. I have
also updated the archive on my homepage.

From: gary@the-gap.demon.co.uk
Message-ID: <35a8969a281920@the-gap.demon.co.uk>
Source record: 97220

Does anyone know if it is possible in Okami, to archive news articles of interest? eg. to have a new internal news group called say 'archive', and copy/move messages to it. This would mean that I could store all articles I find useful and want to keep for ever, but in a format that I could easily access in Okami ie. just like any other newsgroup. I know I could just save the articles to a text file, but that's not nearly as nice.
I hope the above makes sense :)

Also what's the difference between 'locked' and 'protected' in Okami's message flags?

2685. MagxDesk Directory Updates

Newsgroup: comp.sys.atari.st
Date: 1998-07-12 00:00:00 UTC
From: Neil Roughley <roughley@HORMEL.unix.dsoe.com>
Message-ID: <FN_35a834de_roughley@news.dsoe.com>
Source record: 97221

I've noticed MagxDesk doesn't update the directory after a file is saved. Example: I'm in qed and save a file with MagxDesk's target directory in the background -- the directory window doesn't get updated. Under the Ease desktop there's no such problem, which has a setting called 'Refresh window contents automatically'. Is there a way to make MagxDesk do the same?

>For the fontselector problem, I have the env variable
>#_ENV FONTSELECT=AVSERVER in magx.inf.

Right, OK! I have done this and it all works, I get a font selector in
aFTP ..... BUT ..... when I do a SECOND download (the first is OK)
with aFTP I get an alert from AVSERVER (just telling me it is there,
no error message). If I click 'OK' aFTP crashes - 2 bombs. Hmmm ...

So I was wondering if I could introduce a font selector without using
AVSERVER. I thought there might be one in MAGXDESK.

I suppose I could look for that MAGUFSL someone mentioned and try that
instead of AVSERVER.

Another way would be to use some silver conductive paint to bridge the
broken track. That way you don't need to use a soldering iron, so there's
less chance of doing more damage. The only problem is it's very expensive,
7.49UKP for a 3g phial from Maplins. The order code is FY72P. Their web
address is <URL:http://www.maplin.co.uk/> or sales is on +44 (0)1702 554000.

This reminds me to the problem I found on my brothers Mac G3 running
MagicMac and MagxDesk.
I had problems to read Zip's. The first one was oke but after changing the
disk the window still displayed the contents of the other disk no matter
what I did.

I have one of those! <G> Haven't used it for years. IB Computers
were the last of the Atari advertisers in Computer Shopper, AFAIK. It
can read/write IBM formated 360k & 720k floppies. Possibly 320k floppies
also. Never had a bit of problem with mine, and it still worked the
last time I had it hooked up.

2701. NOS Kill file format (was Re: Okami 1.34)

Newsgroup: comp.sys.atari.st
Date: 1998-07-12 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <35a8f43c2357741@the-gap.demon.co.uk>
Source record: 97237

on Thu 09-07-98 11:45 Terry May wrote:

>On Thu 09-07-98 09:27, Gary Priest scribbled:
>
>>I'm thinking of using the NOS kill file format for NEWSwatch, unless
>>anyone can think of a better alternative?
>
>I'm not familiar with it. Can you post a brief description of how it
>works?

Ok. Here is the description of the NOS kill file format, that I am proposing to implement in NEWSwatch. Any comments?

The actual Lines: example will not be relevant with NEWSwatch, because I have implemented that separately from the KILL file. It's actually a seperate preference, as is 'number of crossposting groups'.
Also I plan to have NEWSwatch keep the headers of killed articles, or totally ignore them depending upon another configurable preference.

----------Taken from NNTPCLI.TXT---------------------------

KILL

Used to hold patterns with which received header
lines are compared. If certain patterns match then
the corresponding article bodies will not be
fetched. The format is specified below. If this
file exists then all new articles will be fetched in
two stages: header first then body.

Format of the KILL file
~~~~~~~~~~~~~~~~~~~~~~
The kill file should contain one pattern per line. Each
header line received is compared with every pattern until a
match occurs. A match must be exact, with the first character
of the pattern matching the first character of the header line
and the last character of the pattern matching the last
character of the header line. Case is insignificant and
whitespace is always represented by a single space character.
The pattern may contain special characters as follows:

! If the first character of a pattern is "!" then the rest
of the line forms a "keep" pattern ("!" means don't
kill). If any header line matches a keep pattern then
the article body will be fetched.
~~~~~~~~~~~~~~~~~~~~~~

If the first character of a pattern is not "!" then the whole line forms a "kill" pattern. If any header line matches a kill pattern and no header line matches a keep pattern then the article body will not be fetched.

The "!" character has no significance in any other position and will be matched literally.

? Matches any single character.

* Matches zero or more characters.

[ ] Matches any single character that appears within the square brackets. For example, [0123456789] will match any single decimal digit. The characters can be specified as a range: [0-9] has the same meaning as the previous example.

[^] Matches any single character that does not appear within the square brackets. For example, [^abc] will match any single character except "a", "b" and "c".

\ Matches the following character literally. For example, * will match a single asterisk and \\ will match a single backslash.

The kill file patterns are all loaded into memory at the start of the news session - the kill file should therefore be kept as small as possible. Offline article selection can be performed by creating a kill file containing the single pattern "*". This will cause only headers to be fetched. The message ids of the required articles can then be put in the get file for retrieval during the next news session.

Example:

```
----------------------------------------
Lines: *[0-9][0-9][0-9]*
Newsgroups: *rec.pets*
!Newsgroups: *rec.pets.gerbils*
----------------------------------------
```

The first line should kill any messages with more than 99 lines. Unfortunately some long messages do not contain a "Lines:" line so this is not foolproof.

The second line should kill any postings or cross-postings to the rec.pets hierarchy.

The third line will keep any postings to the rec.pets.gerbils hierarchy regardless of any matches with the other kill patterns.

Note that the header lines of killed articles are retained. The full posting can be fetched later by putting the message

id into the get file.

>Also what's the difference between 'locked' and 'protected' in Okami's
>message flags?

Didn't you once tell me to RTFM? ;^)

protected (p) means the message will not be deteled at the next
expire. Using this flag, important messages can be kept. When p
and k are both set, p prevails.

locked (l) means the message flags will not be affected by global
changes. Flags can be set for all messages in a group, so that,
for instance, a whole group can be deleted at once. Messages with
the locked flag set will not be affected by these global commands.

Now I'm red faced ;-)

TBH. It's because I just *hate* this obsession with supplying manuals in ST-Guide format. Can't stand it!! So tend to skip any manuals supplied that way unless I get really stuck. Give me a good old .TXT file any day!!

Did you change the modem setting from modem 1 to modem 2? The
Falcon modem port from what I understand is modem 2.
I've not set it up on my falcon yet, I'm using my TT. I don't
have a nice big hard drive for my falcon.

Well, I've now managed a couple of successful sessions with CAB and a
download with POPwatch with everything set to 115200, so I'm almost
there. However STinG still seems to pause rather more than I remember
it doing on my STE. Guess that could be a server problem though with
mail and the web proxy, though.

Thanks for the help, G�tz.

My favourite is one that is included in the mouse accelerator,
SilkMouse, which is available on many FTP sites that support Atari
stuff. Latest version is 4.2. With this program, the screen will
reverse and dim the colours of what is currently displayed (after a
user set interval), so white becomes black, etc. After it's been that
way for a (user selected) time, it goes completely black. All in all,
much more useful than any number of flying polygons or toasters.

Hi Gary, That's too bad you don't like HYP files. They are just great.
Small, very Fast, indexable, printable, you can cut/paste directly,
organize all the HYP intelligently, supports pictures (even colors)
etc.
Besides, if your system is quite well setup. For new software, When I
install it, I will just copy the new HYP file in the main stguide
folder, and from the application, I can call it directly. already
where I want it to be. Have a prob with a certain window from THING
program? click on HELP, and boom, the HYP file loads exactly where you
need it, exactly what you needed.

Anyway. That's one of the best thing we have imo for atari. Besides,
MAC also can read directly HYP files directly, and I heard Amiga,
(altough Amiga reader can't read directly the HYP file, need to
recompile it from the STG file).
Anyway. Much more convienient than TXT files in any ways.
Btw where are you going in FLorida? where at precisely?
bye

What I do for this is setting the flags 'lock' and 'protected' (both, to
be on the safe side ;-)) on the particular messages I wish not to be
oexpired.

Following for sale or trade: (Prices Negotiable)

NOTE: WILL TRADE ANY OF THE ITEMS ON THIS LIST FOR PC EQUIPMENT-Hardware
and/or Software. Must be current stuff within one year and newer.

Hardware-

ALL hardware is in good to excellent 'used' condition and pre-tested before
shipping.

1040STf's-(still going strong!)1meg-used/tested.....$50ea.
Includes Atari Mouse or Marconi/Marcus 3 button track ball, your choice.

Atari SC1435's -14" stereo RGB monitor, headphone-jack, video cable,
used/tested...$65ea.

Atari SC1224 12" Color Monitor - used/tested..$40.

Atari System: 1040STf + SC1435 + Atari Mouse or Marconi Track Ball-all
items used/tested.......$100.

Atari PCM124 12" Monitors-New-$20 ea. Original box and manual.
Believe these were used on 286 type computers and Atari's short lived
PC. Two units available. 7-Pin video cable.

LYNX STUFF:

LYNX Kit Case-Carry Case-NEW
12"wide 9 1/4" tall 4 1/4" deep-$15

Comlynx Multiplayer cable-new-$5
LYNX AC Adapter-120V 60Hz-$10

More LYNX STUFF to follow....

ST Software: all games are in the box with manuals

Hardball-Accolade-baseball sim-$5
ST Pool-Shelbourne-rack 'em up-$5
Map & Legends-The Cartographer + Data Mao Collection- $10
Gold Rush-Sierra-adventure sim-$5
Flight Simulator II-Sublogic-with Scenery Disk #7-$10
RISK-Virgin-Word conquest game-$5
Their Finest Hour-Lucus Films-The Battle Of Britain-air combat sim-$5
SCRABBLE-Leisure Genius-crossword game-$5
EZ Test Writer-$5
DragonScape-adventure game-$5
Metro Cross-Epyx-scrolling skateboard game-$5
Data Diet-Disk compression program-$5

StarGlider-Firebird-3D combat-air to air/air to ground sim-$5
Final Assault-EPYX-mountain climbing adventure-$5
Transputor-cool 3D marble action game-$5
LED Storm-Road race with lazers-$5
Crash Garrett-1938 adventure game in FRENCH-$5
Karateka-Broderbund-realistic karate fighting-$5
Championship Wrestling-Epyx-Wrestling Mania for the ST-$5
Phantasm-space shoot-em up-$5
Project Neptune-Epyx-James Bond type adventure-$5
Renegade-Taito-street fighting-cool game-$5
Prime Time-make your own TV shows-$5
Battleship-EPYX-boardgame for the ST-all aboard!-$5

Following-no box OR doc's

Warship-Stratigic Simulatons-$2
Read & Rhyme-Unicorn-$2
Math Wizard-Unicorn-$2
The American Pastime Baseball Simulator v3.01-$2

That's All For Now.....
Buyer pays Shipping.
Payment: Check/M.O. or COD, your choice.
Ship from New York

>>etc.
>
>You mean they are like HTML but not as usable..not accesible by all
>platforms....
no, HTML on atari is painful. Sorry for all CAB users, but try to load
a 135kb file in CAB HTML. Then tell me what you got?
The same document will load about 30 times faster if in HYP format and
will be 1/3 the size. No cigar.
I don't doubt that on a fast computer HTML is the way to go. But
unfortunately open your eyes. Just do the test yourself EVEN on a
falcon. Big pain in the butt for html.
2) the RAM side of it. How big is CAB once loaded? not very
interactive imo. 3) stguide is supported to be directly called from
programs. Depending where you're at in the program. click on HELP and
the appropriate page will load directly. and FAAAAASt :) thats's the
keyword.. speed!!!!

I like when programs give you both, but I have no problem with docs
in ST-Guide format, particularly when they're hooked into online Help
buttons (as Okami is). But yeah, text files do have their advantages.

I have a ordinary aixTT (quite new, but still the 64Mb model), and it works very well with a 60ns 32Mb EDO-SIMM. I had to solder a bit so the card recognised the SIMM as 32Mb and 8Mb, but when that was done everything works perfectly.

Jinnee doesn't support Minix-partitions, so it doesn't know that the files are executable. You'll need to add a tos/ttp/app/prg/gtp extension...

> just about any music shop.

A DIN cord has all 5 pins connected. Some commercial midi cords only have pins 1, 3 and 5 connected. These work just fine with midi keyboards. The midi spec only needs the 3 pins. Atari used one of the unused pins for a THRU connection. So there could be a problem with that.

I have the same problem with newsie 0.9 + Sting 1.15 + Magic 5.13 on a
Falcon 030. Newsie crash sometimes when loading for offline and reading
the mail inbox in the same time : too bad

My input buffer is 4096 long, and when I don't read the mail during
loading, there is no problem ; so I think it's a Newsie problem.

Any solution to this ?

Philippe

Hello!

I got NVDI 5.0 two weeks ago. With it came WDIALOG in a new version. Since
then I have no more access to any GEMDOS drive with the MGFORMAT utility.
It reports Error numbers #4 and #7.
When I deactivate WDIALOG, everything works ok. But then I cannot access
the new NVDI printer panels.

Any hint for me to solve this?
Thanx in advance,

Carsten

Downloading for offline reading works also fine with MagiC.
First with MagiC 5.20, today with 6.01

But another problem while using the FTP Part of NEWSie 0.90:

In whitch way i can switch up a FTP DIR?
Step down from root to /pub/xxx/yyy/zzz works fine, but not
from /zzz/ backwards to the root. Any ideas? Eyeglasses? :->

Yes, the different is the falcon timing at the cardridge port.
It's only a problem whith old scanner software.

I use a old handy scanner from print technik munich.
That doasn't work too with this orignal software. With any ST OK, but
not with falcons.
All what i have to do this job: NoLimit's 2001 V 2.0

That's another Software how supports that fucking old scanner.
This Software comes from Roger Bischoff.

(No adress avaiable in this moment, sorry) Searching the disc :>

I don't know, that's a 50:50 chance for your golden image..??

Ahrg, one year without any atari? :-> horror starts here :)

>So how good is MagiC PC? Is it a viable alternative to buying a real Atari
>out there? Could I run Devpac3 and STinG?

Hm, i don't know about things around MagiC PC, but i can say that MagiCMac6
on a PB 5300cs (Mac OS8.1) works realy great at all. Also it's portable.
Communication works easy with a 33k6 PCMCIA modem card from both platforms.

That 'MagiC Atari' is realy fast, data transfer from one to the other
platform it's only a mouse klick. Easy handling, but an expensiv investment..

(Note(Power)Book, MagiCMac(PC), Modem.. PrinterCable..)

No risk, no fun :->

(Today i saw in our food shop down the street a 200Mhz MMX Notebook for
around 2888 DM, 32Mb RAM, WIN95, Office, CD-ROM 2.1Gig Harddrive..)

That's 'cheap' !?

Source record: 97069

I believe there was once a commerical magazine called '"ST World"
which was the first of the ST Mags to die. Is there anyone who can
provide me with some info about it including a screenshot of the cover
in Gif format? I want to write an article on it and I need to know...

1. What year (and month if known) was the first issue released?
2. What year (and month if known) was the last issue released?
3. Why did it cease publication.
4. General info about the contents IE: tutorials ran, regular features
(news, PD Reviews, other reviews etc).

I would be grateful if anyone could give me as much info as possible
on this.

Note: I am talking about ST World and not Atari World, two different
magazines.

> (I used Windows NT and MagiC-PC 1.3 at that time). Do you have
> HSMODEM installed?

HSmodem was installed when I installed MagiC-PC and I've left it alone. I believe this is version 6 but I used that successfully with my STE for years with no problems. I've only tried 56000 so far so I'll try 115200 and see where I get. Could it be a problem with the system priority setting?

BTW this is with Win95, which probably isn't helping...

Thanks,
John

What would be nice would be if there was an additional message flag
you could set that would flag it for archival. Then the next time
oexpire ran, it would archive any messages with that flag. I would
find that /very/ useful.

What version of WDIALOG did you get? V2.01 can be found on the
Natural Born Programmers web site (sorry, don't have the URL). If
you can't find it, I can send it to you.

It's possible that your "new version" is actually a buggy version
that has since been corrected.

Okay, if I understand it correctly, as long as they're named *.CPX,
COPS (or whatever) will execute their headers, even though you don't
actually open COPS. That's how I thought it worked, but I was
confused by the comment that if you can see it, it's already had its
header executed, because in COPS you can see disabled CPXes (i.e.,
those with a .CPZ extension).

Yeah, hope that's true..
Some other people are waiting sice * weeks * for a simple update!
But it's only a fucking update, equal..

Just got a tt030/4/4/540/TTM195. Finally after all these years! Has NVDI in there too. However there is no screen saver in the Auto folder, and my fave old STARSAVE (v.0.50) from my 1040 is seemingly incompatible. What is the preferred screen saver for TThigh rez, you experts? Is it on the umich site or must I spend more money?

I`m confused. Just got MagiC 6.0 the other day.
After installation of v. 6.0. there was no way I could use the computer
anymore.

Everything got mixt up. The desktop, windows etc.

Had to install v. 5.13 again to use my machine.

I guess I have to read the docs. - arghh. :-(((

cheers

h> figured out), made a bunch of changes to the file areas and message areas
h> CFG files, tried to boot Octopus and it would come up and then
h> immediately shut back down again.

RTFM and look for the debug option, this will log all of Octy's action and
allow you to narrow down the problem, it could be something silly like the
language file need re-compiling, look at the logs with debuging turned on,
octy'l tell you why its sulking.

h> In any event, I've been unable to find Semper.

Perhaps you should log onto a bbs with a terminal and download it with
zmodem, try the <Fortress> BBS on 0181 244 9825, use the filename SMP08
h> I'm currently running FSERIAL to speed up the ports, and its doing a good
h> job, but everybody here recommended Semper.

Look out for a package called HSMODEM, the best port fixer there is.

Filename on the <Fortress> would be HSMODA07.LZH
h> Any ideas where I could find that for download?

Did i mention the <Fortress> on 0181 244 9825

Fully agree with you. I surely don't want a VME-card because the VME slot
is already taken by a Crazy Dots II card and I don't want to go back to
the 16 color mode on my TT.

>ftp://193.190.205.13/Atari/Network/VME/smc_tt1.zip

If the site isn't down like today (13/07 18:30 CET+2). He Karl, if you read
this, fix the server will you.

Glad to hear it. It's quite a complicated format, but seems quite complete.

>>The actual Lines: example will not be relevant with NEWSwatch, because I
>>have implemented that separately from the KILL file. It's actually a
>>seperate preference, as is 'number of crossposting groups'.
>
>Will we be able to have separate settings for Lines and Number of
>Crossposting Groups, for each individual group? If not, consider
>this a request. :^)

Why did I know that is what people would want :(

The answer for now is *no*. I've practically finished the code for lines and
cross posting groups. It's global and not per newsgroup.
To do it per newsgroup is a lot more work and will mean changing the format
of NNTP.DAT again, which will be a *big* pain.

I'm hoping to email you (and a select few) a beta very soon. It may be that
eventually I will have to do it so it's per group, but hopefully for now you
can live with a global setting???

>>Also I plan to have NEWSwatch keep the headers of killed articles, or
>>totally ignore them depending upon another configurable preference.
>
>That is good. I'll probably usually have it ignore them, but might

Yep. That's why I made it an option :)

POPwatch don't you mean?

Just an aside...since you seem to be adding new features...I would
like to be able to DL my mail *without* first seeing the list of
headers. I almost never view the header, and it seems to take just as
long to get the header as the whole email.

Also, I'd like to be able to override the 30 message limit.

I don't know if there'd be much demand for these features though...

:in 4MB. Of course I don't know how big a footprint MiNT has (my Mega
:4ST has been in storage for a few years).

According to reports (years ago) in this forum you can have X with an xterm and a shell up and running without problems (in 4 meg), but thats about it. MiNT itself is not the problem. The Xservers I have here are sized in the range 2.5 - 3.5 megabyte. I'd guess that the one for ST is about the same size.

"of course"? Are you assuming that the power supply cannot be replaced
or bypassed? All you need is +5vdc and a tiny bit of +12vdc, both of
which
are available from any number of surplus computer power supplies.

An svga monitor can likewise be found anywhere.

I don't see your problem. Bring the Falcon on over with you.

>domain as required.

Okay, that seems to work, but what about those diabolically clever
spammers who send out one mass email from or to

so_and_so@1906earthlink.com

and then the next one is from

so_and_so@2765earthlink.com

I guess what I'm hoping for is some sort of wildcard possibility in
Popwatch's killfile protocol. Gary?

Now that I've signed up for the Magic maillist, which doesn't seem to
come in digest form (please tell me I'm wrong), it's harder to sort
thorough all my emails manually, and a functioning killfile would be
very handy.

> find some?
>
> keymastr@cdc.net

You could try CAB (Crystal Atari Browser), a demo version of which
is available at www.flinny.demon.co.uk

Or you could try the Draconis WEB Package which you will find at:

http://dc2.uni-bielefeld.de/atari/edracon.htm

Hope this helps.

As a University lecturer (retired), may I suggest that if the spelling
on your papers is taken into account when they are graded, you shouldn't
be using a spell-checker anyway: and if it isn't, then its use would be
immaterial? Personally, I would support any school which insisted on a
reasonable standard of English and spelling- those who come to rely on
servants/slaves/machines can find themselves in difficulties if they
ever have to manage wthout them.

> same?

Ease uses a resident program "changes" that installs itself in the DOS trap
and protocols every disk change.
changes is a dangerous program and cannot detect newer DOS calls that also
change files. I cannot recommend this way of programming.

Perhaps there will be another way in the future: MacOS seems to change date
and time
for a directory when it's contents are changed. I will investigate this with
MagicMac, but it will not work with DOS volumes.

2790. Okami has reset all the flags

Newsgroup: comp.sys.atari.st
Date: 1998-07-13 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <35a9b87e415ed1@the-gap.demon.co.uk>
Source record: 97188

Just had a weird occurence in Okami. Suddenly (probably during the last run of OIMPORT), all my news messages have been flagged as 'unread', and the ones I had carefully set to 'protected' have been 'unprotected'.

Looks like there could be a bug in OIMPORT that for some reason has *reset* all the flags against messages. Either that or I guess it could be in OEXPIRE?

Any one else had this problem?

Gary

: Now if I look at the data actually written out, it's not at all what
: it should be.

Hmm, that would indeed be strange for such small amounts of data...

: I'm reasonably proficient in C, but am I missing something here or is
: it a known problem (buggy lib etc.)

The only thing I can think of is that with large amounts of data, you should keep in mind that Sozobon's "int"'s default to 16-bit, so you might not pass a full byte-count. Use -mlong when compiling the program and see if the problem goes away...
Sozobon is a nice compiler, but it has its problems, especially when you try to use it to port stuff... (malloc with 16-bit parameters isn't a good idea if you ask me, also because lalloc() isn't very portable...)

Anyway, good luck...

Noooooo! Just that the appropriate initialisations are done when the
CPX-handler discovers them and executes their 'headers'. You don't
need to open up the CPX manually for this to be done. So I just let
COPS rootle through /CPX/ initialising for those that are active then
it disappears automatically.

So does CAB 2.7, it`s very quick in loading from the cache. Page and picture,
at least it is in the final version.

>Its all very nice. I jsut wish it worked with STiNG. Draconis works well
>enough, but after noodling with STiNG until I got it just the way I want
>it, I don't fancy going through all that again with another IP stack.

Agree on that one to,- why can`t they all work with the same TCP stack?
I-Connect is so easy to set up, why don`t they (ASH) make it work as an ACC?

As it is now, you have to use MagiC. MagiC is nice and NVDI is fast, but not all
use it, and it does not work on the Milan, - yet!

: > VME bus. Since this might be handy for the Atari community, I'm
: > asking your help.
:
: I don't know if this is really what the Atari community needs. Not every
: Atari computer has a VME bus. That's why I think an Ethernet interface
: to a SCSI bus would be interesting. Every Atari computer would be able
: to have Ethernet that way (for ST's with Link off course).

To shed some light on this project : it is my THESIS ! So, whether it
really will be useful or not, I'm doing it anyway. I believe the result
my be of great help to all Atarians :

* If it is viable : cool, let's make them !
* If it is not : well, then we'll know why not to make it.

There may be kazillions of different solutions for the Atari->Ethernet
problem, but I'm focusing only on VME->Ethernet. Since some Atari's have
VME....

: Don't forget there allready exist Riebl cards for the VME bus and there
: is also a do-it-self package available to build your own VME ethernet
: interface based on the SMC ELITE ULTRA card.

As far as the Riebl cards are concerned : weren't they all sold out?

Thanks anyway for the pointers !

To all future responders on this thread : PLEASE do not talk about
SCSI or other solutions than VME, since our VME crates don't know what
to do with them.

Thanks to all who responded so far,

Just format the disk on your PC as a 720K disk using the DOS command
like this

Format A:/f:720/u

then it should be able to copy file on it from your PC, then put it in
your ST and it should read it. Older TOS versions would not format in
a PC conpatable format. TOS 1.04 fixed this.

Enjoy. Mike

I always liked the 'Idle' screensaver on the TTM195. That rotating Fuji symbol has lots of room to move around, and you can see a few extra galaxies ;-)

You _must_ try an early version of mgif on your TTM195. I think it was version 4 that allowed the viewing of greyscale gifs by using a cool flickering method. I used to preview multi-bit graphics with mgif on that big monitor -- just sit back a few feet and you'll swear you're looking at a huge black-and-white photograph. The effect is amazing.

Another thing you might want to experiment with is VGA-Simulator 1.07. It's a German screen emulator written specifically for the TTM195. At one time I used a few programs that wouldn't run in 1280x960, but under VGA-Simulator they ran fine.

Hi All,

This is just a quick message to say thanks to all that
replied to my plea for help when I mangled the partition
information on my Hades IDE Drive the other week. I
received a lot of helpful replies and it's great to know
that there are a lot of helpful Atari users out there.

I have now fixed the problem and so everything is back
to normal.

Thanks again.

Regards,

Ben Hills.

: When Atari saw that the Amiga was going to be a hit, they got their acts
: together and rushed out the ST concept, that was developed at Atari in
: less than a year by many former C= developers.

Ataris "rushed" ST concept would be today considered good engineering.
It is IMO not true that the ST is a computer designed in a hurry and with
little ressources for further development.

As any larger PC company today, the ST is a system, where the engineers
did not design too many things on their own, but bought
on the markets standard parts to build the computer. It may have been
because
of lack of time but today this is done constantly.

The ST existed more or less before, it is in many ways a "CP/M 68k" work-
station, because TOS was in fact the operating system CP/M 68k developed
by Digital Research used with many other computers. They just added
the sound chip from the CPC, the DMA chip (a cut down version of a SCSI
chip by Western Digital), MIDI interfaces, B/W hires graphics like
the MAC etc. with industry standard chips and the ST was ready. A flavor
of a CP/M 68k workstation.

Once Atari started designing their won hi-tech chips for the Falcon 040,
the ATW, the Jag etc. it was the beginning of the end. Development time
and cost probably exploded (remember you also have to write the software
and OS support for the custom chips), the additional performance
compared to industry standard chips was in no relation to development
delays and it may also have been that because of the smaller
quantities Atari probably couldn't make use of economies of scale. They
should have sticked to the ST approach, that is now paralleled in the
Milan design.

IMO it is also the too hard to enhance, support and further
develop
custom chips and hardware dependent OS that created the basis for the
downfall of the Amiga.

In December 1990, the editorial staff of the disk magazine "ST News" organised a big convention in Oss, the Netherlands. In attendance were over 100 of the finest demo coders and programmers known on the Atari ST system, including TEX, TLB, TCB, OVL, Delta Force...the list is too long.
At http://www.scriba.org/stniccc2000 there is now a site that is dedicated to the organisation of a reunion of that convention, to be held in December of the year 2000. If you attended the original event, don't waste another minute and get your butt over to the Organisation & Information site of the ST News International Christmas Coding Convention 2000 site!
See you there...

The only explanation I have is that your index files were somehow
corrupted or missing. oimport automatically restores them (if it can),
but information about message flags is lost, so all messages are set
to `unread'. Look in your log file.

>it's out of the way until you need it.

I am against the idea of Okami creating a special archive group. If you want to keep messages, you can do so by setting the appropriate flags. You can get them "out of the way" - by which you, presumably, mean "not on the screen" - by using the message mask function.

If you insist on it, you can create your own "archive" group. One way would be as follows: Create (if you're not a UUCP user) a file called "news.def" in the news directory and specify its path in o.inf ("merc.newsdef="). Put the name of the archive group in the file (or add it to it). Create the directory hierarchy corresponding to the name of the group (e.g. "my.archive" = ..\news\my\archive\ Save the messages you want to keep in the archive group in the directory ..\news\my\archive\ using running numbers as names (no extensions). Call `oimport -Mu', and your messages will be imported.

An easier way, perhaps, would be to create a SOUP file of the messages you want to archive (with ofind), and then write your own AREAS file. You can find out how an AREAS file should be constructed by writing a test message and exporting it with `oexport -Ms -d directory -U'. Or you can study the SOUP documentation available on the Net.

>
>Try terminating the string since it is less than the allocated amount with:
>char test[32] = "Some test data\0"

That won't make any difference because:
- String literals in C are already implicitly terminated by \0
- In any case, fwrite just writes a stream of bytes and string terminators are irrelevant.

What you probably need to do is pad out the string with spaces to its full length (*31* characters, remember the implicit terminator!), or take the real length into account in the call to fwrite, ie replace
fwrite(test, 32, 1, outfile);
by
fwrite(test, strlen(test), 1, outfile);

Try using Bigscreen, or MonSTer virtual screen with the STe in low resolution. With CAB and greyscale option you get a virtual 640x400x 16 greyscale. Much better than ST med, or turn the pictures off.

I dob't know if Adamas has a greyscale mode.

OOOOOOPS!!! no way to boot either? did you try to config the magx.inf
with MAGICCNF.PRG (delivered with my magic-update)?
that was very easy to me. ii¿½m using EASE as desktop. no problems to
install.
did you reboot directly after installation?
i would recommend first to take a look in the AUTO-folder, delete the
added MAGXBOOT.PRG, configure the MAGX.INF (and check it with an editor
or MGVIEW (doubleclick), too!), then reboot.

which desktop are you using?
was MAGICDESK there after reboot?
what about the shared libs (check cookie entries!)?

there must be a way to get it running.... lets try again! ;-)

greets -micha-

This needs a little addendum. There are two kinds of SOUP files:
binary ones and non-binary (textual) ones. The non-binary ones are
identical to rnews files. The SOUP files created by ofind I talked
about are binary ones, but you can also create an rnews file and write
the proper ARES file for that. The SOUP files oexport creates are
binary files for mail and rnews format for news.

the best way I could probably recommend would be to log onto your
account using a terminal program; follow and respond to the prompts on
the screen, then when it starts to handshake, disconnect and save it as
a text file using the capture buffer. Then use the Dialer to write in
the prompts and the responses. This is how I configured STinG myself.

Hi all!

Just thought I would drop by and see how the Atari world is doing!

I owned an Atari 400, 1200XL, 1040st and finally TT030!!!

What a great time I had!

Can anyone bring me up to date on the Atari world as far as any
new machines, etc. I saw something about Milan and there being a TOS 5.x???

Also, anyone remember the company that produced NeoDesk? I
think it was Gribnif or something? Did they ever reveal what the
heck the name of the company meant???

Talk soon!
Anthony

From: guitarmn@earth.execpc.com
Message-ID: <6oh26h$iom@newsops.execpc.com>
Source record: 96999

>Well, STing connects, and gets a host as well, but when I try to use CAB,
>either 1.5 or 2.0 demo, nothing happens. CAB won't go to a site, it just
>immediately goes to a blank page with the site's title.
I've checked to see if I can resolve the host (I can), as well as traced
the route. This CAB folder worked fine with CAB until my ISP would no
longer support my SLIP account and I had to switch. Charles Silver has
been helping along the way, but this last problem is a bit strange. I
feel so close, yet so far away...Well, any suggestions, Atarians?

Is that with the latest version of BubbleGEM? I had problems with
CAB 2.7 and the latest BubbleGEM. I re-installed the latest ENGLISH
version of BubbleGEM and the problems went away.

I think the latter. It certainly ignores the Falcons nvram settings.
When I use LED Panel's clock under TOS I get MM-DD-YY, but under
MagiC I get DD-MM-YY. So, I just use MenuInfo's clock and set it up
the way I want it. :^)

2834. Magic 4.02 doesn't like BGM

Newsgroup: comp.sys.atari.st
Date: 1998-07-14 00:00:00 UTC
From: Jeff.Thomas@taf.ftn.org
Message-ID: <03b_9807152120@tor250.org>
Source record: 97003

Just installed Magic v4.02, and after several tries I seem to have it mostly stable. I say mostly because it gives me three bombs when I click on the icon for a drive partion that uses the BGM extended partition formatting scheme. When I run NeoDesk 4.05 from Magic Desk, it allows me to access the partition, and run programs, but eventually things bomb again.

Anyone know what's going on here? I'm using ICD Pro Utils v6.4.3 should that be a problem? Is it just that Magic Desk is incapable of handling BGM extend partitions, and that a different desktop replacement would do the trick. Is NeoDesk useable in the Magic environment without any serious problem?

Lots of questions. ;-)

Dunno about NEWSie but Ant-Mail supports multiple e-mail accounts. If
you're set on using NEWSie, though, why not create multiple copies of the
program and configure each one differently. Not very elegant but it would
work.

A simpler way would be for Mark to make up a variety of PREF.INF
files with an address of each e-mail account (naming them MARK.INF,
MITZI.INF, JUNIOR.INF, FIDO.INF - you get the idea) and then loading
them into NEWSie whenever they're needed (NEWSie supports loading and
saving of individual PREF files).

Still, that might be something John might want to consider as an
option (multiple e-mail addresses) for putting in future versions of NEWsie.

I see this rumour from time to time - and its not true, and never was.

The AixTT can run with EDO DRAMs fine. The AixTT does *not* handle some
types of organization (#rows/columns), so it may *seem* that you swap EDO
for FPM and it works afterwards - however, this is not caused by EDO not
working. There are FPM DRAMs that do not work for the same reason.

OK, here it is again. Such a deal I can give you. Please come and get it. If
I have to move it to my new location, the price will go up.

The following is For Sale (Long Live Atari!):

I'm in the process of moving and I don't have time to ship. I live
in the Chicago, IL area.

Atari TT with internal HD (40 Meg.? I thnk). It comes with the
color monitor, PTC1426 and 8 Megs. of RAM (4 ST, 4 TT0 and
an external hard drive which I believe is 400 Meg. I will also a 24-pin

dot matrix Toshiba printer for sale and loads of ST and TT software.
I also have a Migraph Hand scanner which can be used with a ST or TT.

I can't believe someone has not snatched up this one. I can give you
such a deal!

All for $450 or Best Offer!!!!!

In article <900346425.65901@michelob>
"Charlie Wood" <spidersi#@sprint.ca> said:-

>I've decided to let go of Notator.

Hello Charlie,

You have posted this article in 3 or 4 groups separatly, could you
please crosspost the next time? Crossposting is posting a single article
(single Message-ID) in 2 or more groups, listed in the Newsgroups header
separated by comas. It's better for bandwith and we don't have to read
it 3 or 4 times... But even better would be to post it in only one
group, the most appropriate.

In a crosspost there is only one message stored on the server,
shared betweeen servers, and dowloaded by readers. In a multipost there
are as many copies stored, shared and downloaded as there are groups...
One should never multipost. In fact excessive multiposts (EMP) over
about 20 groups are even automatically cancelled by robots (see
newsgroup news.admin.net-abuse.usenet).

Thanks, bye. Bruno.

PS: No need to prepend your subject line with ">>>>>>", your article is
not more important than others...

Message-ID: <6og42r$65k$1@nnrp1.dejanews.com>
Source record: 97103

I am trying to get Sting going on my trusty Atari 1040. I can get it to Dial, but not connect. My ISP uses PPP, but I do not know what type of authentication it requires. I have tried using PAP, but I cant get logged on that way. I wrote a script for the dialer which does log me in, and gets the IP address assigned to me, but then it times out and the ISP hangs up.

After the ISP sends the IP address, what should STing do? I presume some sort of PPP confirmation. The STing message is 'Link Initializing'. Any ideas?

Thx.
Wade

Whatever. I have seen bizarre string requirements like I mentioned with various flavors of C compilers on different operating systems. All were quoted by the MFG as "ANSI C" compliant -- obviously which was not quite the case. I offered it as a suggestion only (I did say TRY it), not as a defacto absolute fix.

>Can anyone tell me what is going on here, what this message means?

I don't know anything about Graftool but it's a fairly safe bet the
above entry is an AES message. Maybe Graftool bungs messages it does
not understand into the logfile?

In any case I'm pretty certain I've seen the 0xBABA (also babb and
babc iirc) message number before but a quick 'grep' through my header
files doesn't locate it/them unfortunately. :-(

It is possible the message belongs to ICFS, which is a system
extention that supplies iconfication support for any Gem version,
provided the program has been written to understand it of course!

The quick answer is - don't worry. Gem programs should ignore any and
all messages they don't understand.

I'm not familiar with Soz. The code should work but as it doesn't I'll
point out issues that come to mind. One of them must be causing it to
fail! ;-)

>#include <stdio.h>
>#include <stdlib.h>
>#include <fcntl.h>
>
>char test[32] = "Some test data";

Any need to explicitly state the array size?
char *test ="Some test data";
is more usual.

>FILE *outfile;
>
>int main(int argc, char *argv[])
>{
>
> outfile = fopen("foo.dat", "w");

If the intention is to always create a 32 byte file then binary mode
is preferable (consider '\n'). Additionally, the trailing bytes after
the terminating nul char are effectively undefined. Okay, so Soz
should initialise the data segment (perhaps it doesn't?) but it is
always best to do it yourself.

> fwrite(test, 32, 1, outfile);

This is what makes me think you want to create a 32 byte file rather
than just write out the string, else it'd be fputs() etc. Does it work
when you fopen("foo.dat","wb")?

If not, then look up the fwrite declaration in the header. Typically
it is defined thus:

```
size_t fwrite(b,r,nr,fp)
const void *b;
size_t r;
size_t nr;
FILE *fp;
```

but in older systems size_t may have been omitted and replaced with
'int' or 'long'. Basically, what you're after is checking that
sizeof(32) == sizeof(size_t) [or whatever replaces size_t]. I'm not
explaining this well! :-|

> fclose(outfile);
>}
>
> (error checking etc. omitted for simplicity)
>
> Now if I look at the data actually written out, it's not at all what
>it should be.

If the file length is not 32 bytes then it is most likely that:
sizeof(32) = sizeof(int)
and that the fwrite declaration takes
sizeof(size_t) = sizeof(long)
arguments for 'r' and 'nr'.

If the file length is 32 then there is a possibility that Soz is not
zeroing the data segment and whatever program you are using to look at
the foo.dat contents might interpreting the trailing 'garbage' values
an console control codes. Use 'od' rather than 'cat' to view it and if
foo.dat still contains garbage then you're most likely looking at a
bug in fwrite ascii mode.

> I'm reasonably proficient in C, but am I missing something here or is
>it a known problem (buggy lib etc.)

Failing all the above you'll have to trace the fwrite object code!

Oh,- it did boot, but something vent wrong. No access to windows, for one thing.

>did you reboot directly after installation?

No, I did move the MAGXBOOT.PRG from the AUTO-folder into my CONFIG-Folder
where I have CONFINST.PRG, kind of like XBOOT.PRG, But that didn`t help.
BTW.- I`m using MAGXBO32.PRG

>i would recommend first to take a look in the AUTO-folder, delete the
>added MAGXBOOT.PRG, configure the MAGX.INF (and check it with an editor
>or MGVIEW (doubleclick), too!), then reboot.

Have to look at the MAGX.INF file

>which desktop are you using?
>was MAGICDESK there after reboot?

Sort of there,- the MAGICDESK was there, but I had now way of using it.

>what about the shared libs (check cookie entries!)?

Have to look at this one to.

>there must be a way to get it running.... lets try again! ;-)

Well,- I have to read TFM. That always the last thing to do. And then I`ll try again.

I was under the impression, from my first experience with MAGIC 5.12, that everything will
go smootly. But not so.

When I first installed MAGIC 5.12 and NVDI, everything was so easy, it worked after first
try. Guess I was spoiled then?

cheers

I'm not sure about compatibility with high.rez. but I use SILKMOUS
v4.02 on all the other TT modes. It's PD and and simple - appears to
cause less trouble than some of these fancier ones.

>idea how to configure it. Judging by the German docs, it looks like this
>is what I need? Or is there some other way?

Good question! I asked that when I first bought MagiC, but never got
an answer.

Along the same lines, I downloaded ISO-TIME.PRG from the SPIN! site,
which establishes a cookie for a new ISO time standard that helps to
aleviate the confusion between different time formats in different
countries, as well as any Y2K confusion.

Though there are several variations, in its simplest form, it offers
a YYYY-MM-DD format (from big to small, like the standard time
format). Another benefit is that it allows for very easy sorting by
date, because of the big-to-small format.

Sounds like a great idea to me, but do any programs actually support
this cookie? I've installed it, but have seen no difference in any
of my programs.

Okay, I did this, but then the next time I load Okami, they're back
there on the screen. Is there any way to give that more of a
permanent setting? Obviously, you want to be able to get to them if
you need to, but is there a way to permanently set the message mask,
so that they remain hidden until you change the message mask?

From: atari@ebox.tninet.se
Message-ID: <6og8hg$9q3$1@cubacola.tninet.se>
Source record: 97118

Hi all!

I have problems to use Screenblaster III with MagiC 6.0. The logfile says that Screenblaster can't find the SBR-files. I've tried to move them around with no luck. It works with Magic 5.20 and my old N.AES.

Seems that MagiC have problems with paths? during the boot-up.
When I excluded the MagiC HOME-path and returned the PATH environment-variable, my other apps find their own config files.

And the boot-up logo and the background pattern is only black/white, why? I've changed the NVRAM from 16 to 256 colors with no effect. The IMG-pictures is 256 and 16-colors.

but the GEM-windows is really something, every app look like a update, now.

Just out of interest.. We use Twist 2 on a Falcon with a reasonalbly
large database (17000 Clients). Do you ever get a "too many open
files" message when using more than 8 relationaly linked files at the
same time.
```

>> : it should be.
>>
>
>Try terminating the string since it is less than the allocated amount with:
>char test[32] = "Some test data\0"

Nooo!!

The nul does not get placed at test[31]!! It *always* gets placed in
the byte immediately following the string.

```
main()
{char c;

c = "foo"[3];
printf("%d\n",c);
}
```

will produce zero, as would 'c = "wibble"[6]' etc.

The above isn't a trick btw. When the compiler sees a string it simply
invents a name for it and declares it to itself as it were, something
like this:

```
static char L1[4] ={'f','o','o','\0'};
static char L2[7] ={'w','i','b','b','l','e','\0'};
```

(ie it always appends a nul).

So as far as the compiler is concerned it is actually seeing this:

```
c = L1[3];
```

which is why the above works, as does the next stupid statement:

```
"foo"[1] = 'a'; !!!
```

>length (*31* characters, remember the implicit terminator!),

It isn't necessary but it could well be another reason why it isn't
working. Staying with the same scheme as my other posting:

char test[32] ="foo";

Compiler should behave like this:
Invent name for "foo", say L1
static char L1[4] ={'f','o','o','\0'};
memcpy(test,L1,4);

The bug might be that it is doing this:
memcpy(test,L1,32)

or just as bad:
test = L1;

Who knows! ;-)

as both of them contain 'earthlink.com' both should still be killed. It
works with all those I keep getting from 'hotmail.com' so there should be
no difference.

> I guess what I'm hoping for is some sort of wildcard possibility in
> Popwatch's killfile protocol. Gary?

It's already there. All it does is look to see if an entry in the killfile
is anywhere in whichever in the From: To: or Subject: lines. It's explained
much better in the POPwatch docs under 'MAINTAINING THE KILL FILE'.

What are you actually expecting? With the same code I got a file 32 bytes
long containing "Some test data" and 18 '\0's.

> I'm reasonably proficient in C, but am I missing something here or is
> it a known problem (buggy lib etc.)

Not sure about this. The libraries I used were carried over from v1.x as
I knew the basic ones didn't have any (visible) bugs. Since I've still not
seen any, I'm happy to keep things as they are.

It looks very good indeed but I've got a silly (possibly) question. Is there
to be a way of modifying/adding to the killfile within NEWSwatch or will we
need to do it manually with a text editor?

> >>The actual Lines: example will not be relevant with NEWSwatch, because I

More than likely anyway. It seems that most spam is crossposted to 6 or more
groups at a time.

Another thought about this would be to have a global setting and be able to
have some groups with a lower setting, with the lower one prevailing. Oops,
looks like I'm making more work for you ;)

On 13 Jul 1998 16:45:18 , Deano wrote:
|I believe there was once a commerical magazine called '"ST World"
|which was the first of the ST Mags to die.

It was one of the best. My collection starts with issue 14 dated April 1987 but its title at that time was ST User International. From issue 15 it was called ST World. I think there was another publication at the time for pre-ST Ataris called Atari User, or some such, and the publishers objected to the new title.

The last regular monthly issue I have is number 48 and then I have nothing till issue 53 (October 1990) by which time it had become a quarterly. I also have two issues of ST World given away free with Atari ST User. The first has no date but as the second is dated July 1991, I presume the first was also 1991.

Contents of the September 1988 issue are:

News

Interview with a musician (ST and Midi user)

ST World I/O (an information and opinion exchange)

Master CAD - a review

PostScript - an explanation

The World of Midi - part 7

Twist - a review (this was an application switcher, not the database)

Connections - a guide to connecting the ST to other computers

ST World at large - a visit to University of York to see a ST-based composition system

Font Editors - a comparison of Jackfont, Fontkit+, Fontz! and Font Expert

Programmer's Clinic - excellent

Dungeons and Disk Drives - a regular feature reviewing adventure games

Book Shelf

I cannot say why it folded while others kept going but I suspect
that the market was not big enough to support a quality publication.

I cannot supply an image of the front cover.

John Logan

Hi!

Is there such a thing as a multitasking-friendly MIDI-player that handles standard MIDI-files? I've found several, but they either hog the CPU, doesn't work on my Falcon040, doesn't like MiNT etc. I don't need anything fancy, just a piece of software that can feed my GM/GS/XG card in the background and doesn't hog or crash the system.

> --
> jason newstead

You shouldn't need one, except if you have one of the very first
1040ST's that didn't have TOS in ROM, in which case, you should rather
look for ROMs instead of a boot disk.

Try leavin the computer on for a few minutes without a disk in the
drive. The desktop should come up by itself. Then format a DD disk using
the desktop option. Booting with a correctly formatted disk in the drive
is instantaneous.

This is all in the Quick FAQ...

Cheers,
Nick

Did that, thus how I can connect and get logged on and the IP address, but
what happens next the terminal program will not tell me. It looks as if it
is waiting for some sort of confirmation on the PPP connection.

I dont use XControl (I thought it needed an STE or something?) so basically I
have nothing in the root AUTO folder. I manually start the HSMODEM driver,
then run the STING loader (whatever is in the STING\AUTO folder), then I run
the STing Dialer program from the STING\BIN folder. Maybe the key is in the
use of the CPX?

>I know there is a RIM (M&E) for this scanner. It's shareware.
This driver is made by the French programmer Eric da Cunha. As far as I know, the Golden Image Scanner will not work on a Falcon, because of timing problems. It works on the Mega STE, but only at 8Mhz. As opposed to TouchUp, Eric's driver switches automatically from 16 to 8 Mhz and back when scanning.

Hope this helps,

>

No, - that`s not what I mean.

On my HP I have a link to www.showstat.com, it`s a kind of tracker that tells you how many visitors you have,- where they come from,- what kind of system,- what browser and a lot of other things.

BTW. it`s open to anyone, just click on the little red icon in the upper left corner, and it brings you the page with all the stats.

If I try that with CAB 2.6, this stat page will show that I use CAB 2.6 and I-Conn OVL 1.1 file. It didn`t show what system I use.

This isn`t the case with CAB 2.7. Then it just read Unknown to system and Unknown to browser. Apperently it can`t see what kind of browser I`m using when it is CAB 2.7.

cheers

Joergen

2896. FS: Falcon030, 1Gb HD and Expose (UK)

Newsgroup: comp.sys.atari.st
Date: 1998-07-15 00:00:00 UTC
From: Carl Woffenden <carl@arachsys.com>
Message-ID: <35AD0B8B.65075671@arachsys.com>
Source record: 96902

As the title says, Falcon030 4Mb, boxed with manuals, 1Gb Seagate external SCSI drive and Exposi¿½ digitizer for sale in the UK. Software includes:

Lattice C, 5.6 (I think) boxed with manuals
Apex Media, again boxed with manuals
AudioTracker (8 channel HD recording package with hardware key)
HD Driver

A few games, inc. Obsession and Elite II

Loads of Atari mags and cover disks

cables, mouse, monitor adapter, etc.

It's a sad thing to have to part with, but I've had enough with trying to upgrade it: Titan Designs not giving my Nemesis back hasn't helped. The machine's been sat waiting for its Nemesis re-installing for over six months; it was used professionally before that. A rush job meant buying a Mac to replace it. Then a PC.

Possibly even a Microvitec GPM1701 for sale, too, as a bundle. It does all Falcon resolutions from PAL to VGA (17 inch). It's less than six months old.

Offers via e-mail.

Thanks,

Carl.

** The following Atari 400/800 cartridges request the pleasure of
meeting your Atari computer.. **

** All the wonderful cartridges below are clean and are in good,
working condition..
** All the fabulous cartridges below are LOOSE, unless otherwise
noted..

Ii¿½ve rated the game labels using a ï¿½C1 - C10ï¿½ scale utilized by toy
collectors worldwide:

C1 - 5 = ranging from poor to fair condition
C6 = the ï¿½medianï¿½ condition range for ï¿½goodï¿½ items that collectorï¿½s
typically want in their collections..
C7 = good+ condition
C8 = very good condition
C9 = near excellent condition
C10 = excellent condition

- "Buck Rogers": very nice, shiny, label (C8) = $6.00

- "Deluxe Invaders": by Roklan, label is almost completely faded, hard to
read, not ripped or torn, just very faded (C1 for fading, C5 for
completeness of label) = $4.00

- "Gyruss": label is all text (C5) = $5.00

- "James Bond 007": label shows average wear, all text (C5) = $6.00

- "K-razy Antiks": (C6) = $5.00

- "MPP Smart Terminal": label is "wrinkly" (C3) = $3.00

- "Ms. Pacman" (2 cartridges): XE-type case, all text (C5/6) = $4.00/ea.

- "Midnight Magic" (pinball): XEGS-type case, illustrated, small piece of
??? rattling inside (C6) = $4.00

- "Miner 2049'er" (2 cartridges): one of the labels has tiny nicks/tears at
the top, the other is nicer and no nicks/tears (C4/6) = $4.00/$5.00

- "Pole Position": XE-type case, small wrinkling in upper left corner of
label (C4) = $3.00

- "Princess and Frog": by Romox, nice label, illustrated on BOTH sides (C6/7)
= $9.00

- "Shamus" (2 cartridges): red, opaque case(s), one has a label that is
wrinkled and peeling at the upper-right corner and the other shows average

wear.. (C3/C5) = $4.00/$5.00

- "Star Trek: Strategic Operations Simulator": one very teensy, tinsy nick on the end of the label where it folds over (C6/7) = $7.00

- "Submarine Commander": by Thorn/EMI (C6) = $5.00

** Please send me your SHIPPING ADDRESS and a PHONE NUMBER that you can be reached at to confirm your order and I'll make sure the game(s) are set aside for you..

** Shipping and insurance is $3.75 via U.S. Mail ï¿½Priorityï¿½ for the 1st game and $.50 each per game, thereafter.. Shipping prices quoted are within the Continental U.S.A. only; Canada and overseas, extra..

** TERMS: Money Orders and Checks accepted. Money Orders are accepted for immediate shipment upon receipt of all items ordered. Checks are accepted with a 7-10 business day wait for clearance before any items ordered are shipped.

** PAYMENT INFO: Please make Money Order(s) and Check(s) payable to Chris Stafford and mail to this address:

Chris Stafford
P.O. Box 1482
Lompoc, California
93438-1482

** CONTACT INFO: I can be reached via e-mail; KITSCHY@THEGRID.NET for any questions you may have; phone number available upon request..

** I have EXCELLENT REFERENCES for completed internet transactions available upon request.. I strive to provide the BEST service possible..

>It just says Unknown to browser and Unknown to System.
>Why is it so?

Must be a CAB.OVL thing, because with Dan Ackerman's CAB.OVL
ShowStats shows CAB.

Speaking of ShowStats, do you have to do a reload everytime you go to
that site to get your latest update? Whenever I go there CAB uses
the page in my disk cache, and I have to click on reload to get my
latest stats. Maybe that's a CAB.OVL thing too.

The scanner will NOT work with a Falcon, it will work with the
ST/STe up to and including the TT. Touch Up is the software for
it.

I'm not so sure of that. With Bubblegem disabled or not I got at the end
of the log two lines like this:

MU_MESAG 001E 0000 0000 0004 0000 0000 0000 0000
MU_MESAG 0048 0006 0000 0002 003E 0006 0033 AF6C

A few weeks ago however these lines were repeated every x-seconds. Now
(with or without Bubblegem) I only get these lines at the end of every
picture load and they aren't repeated anymore.
I've change my setup after my first posting but I can't recall me what
I've change though. I'm using now a newer version of freeMiNT, newer
version of Taskbar etc..

BTW: With Firenews v0.75 I don't have the problem you describe
I'm using Bubblegem 7

| . . .

Yep! Maplin still have them. Part number GW66W. "A low-cost range of subminiature microswitches produced to an internationally accepted standard size and operating characteristics." I bought 10 and a tube of their silicone grease (for the rollers) and have been conducting a "Mouse Rehabilitation Week." The "low-cost" concerns me and I suppose it is only a matter of time before the replacements fail as well. (On the Naksha I simply swopped the right and left switches.)

I presume further searching should identify a supplier of high quality microswitches. The Naksha mouse's switches had the name "Zippy" on them. Anyone know who supplies these?

Indeed. Have you ever asked them? I've been meaning to email them,
but haven't gotten around to it yet. I doubt if it will do any good,
because it probably works fine with NS and IE, but you never know.

2910. TOSBOX beta page

Newsgroup: comp.sys.atari.st
Date: 1998-07-15 00:00:00 UTC
From: Mark Slagell <bald_soprano@usa.net>
Message-ID: <35AD7681.5085@usa.net>
Source record: 96916

A Tosbox beta test page is now publicly accessible. This seemed
sensible since I've been doing more work on it lately than I expected to
have time for, and it's rather inconsiderate to those running mirror
sites if too many new versions get released in too short a time.

Registered users please note: if version 1.06 is refusing to run, you
can do either of the following:

1. Rename your OTAB.DAT file to something else so a new one has to
be built (unfortunately this means typing in your registration
key again)

- or -

2. Download the current beta, which just doesn't have that problem.

PLEASE read the extra disclaimer on the beta page if you are going to
download from it.

http://www.geocities.com/SiliconValley/Vista/4448/tb_beta.html

Thanks for the continued feedback, everybody. -- Mark Slagell

Source record: 96917

Just powered this old thing up and boy was I shocked! I haven't had to run this in a while and I'd forgotten a lot about the thing. I used to have a hard drive (20 Mb from when that was a big deal) but it is apparently not working. The rest of the system works fine except the mouse seems slow in comparison to the Macs, PCs, and Suns I've been working on lately.

I want to sell this to someone who could use it but I haven't got a clue of what this is worth. I'd like the price to make it worth the effort of packing and shipping. (I'm in El Paso, TX.)

Someone, make an offer on this. I've got really fond memories of my Ataris (one 520ST, two 1040STf...) and I'd hate to just toss it in tomorrow's trash.

Thanks,

Dan

BTW: This is pretty much a stock unit from the late eighties with "Rainbow TOS" (I think I remember they called it that...) in ROM. Great cosmetic condition. 1040STf, SC1224, mouse, power cables, monitor cable...

The messages being displayed in GrafTool are caused by BubbleGEM. I've seen the same thing. If I disable BubbleGEM, the messages don't occur. FireNews is also affected: everytime the mouse is moved a dialog appears showing its x and y coordinates (very annoying).

>
> Good question! I asked that when I first bought MagiC, but never got
> an answer.

Hmmm... so nobody has an answer. Maybe things are reliant on the application to change the date format. NeoDesk, for instance, can be configured to show different formats. Mind you, that's applicable only to NeoDesk -- the rest of the 'system' will still use the UK default.

Although I may be wasting my time trying, does anyone know how to change the bits in a cookie? The docs for dtcookie state this:

Der "_IDT"-Cookie im Detail:

Bit 0..7: Trennzeichen f&#65533;r Datumsangaben
(Null steht als Default f&#65533;r '/').
Bit 8..11: Datumsformat,
(0: MM-TT-JJ, 1: TT-MM-JJ,
2: JJ-MM-TT, 3: JJ-TT-MM.)
Bit 12..15: Zeitformat
(0: am/pm, 1: 24 Stunden)
Bit 16..31: reserviert

According to Profile 2, the cookie does get installed. But how does one change the values to test the different formats? Or would MagiC just ignore the cookie's settings anyway?

Does anyone know when we will actually be able to buy NVDI version 5?

And about the printers.. I have used an Epson Stylus Color 400 printer
under NVDI version 4 with the supplied drivers. It works fine for 360 DPI,
but I was unable to get it working at 720 DPI. I rang Epson and asked
about the technical information that would enable me to create a driver
for 720 DPI, but they would only offer to sell me a very expensive
technical manual. Wouldn't it be nice if this information was still in
the _user_ manuals like it used to be.

> The messages being displayed in GrafTool are caused by BubbleGEM. I've
> seen the same thing. If I disable BubbleGEM, the messages don't occur.
> FireNews is also affected: everytime the mouse is moved a dialog appears
> showing its x and y coordinates (very annoying).

You didn't install the bbl cpx, did you ? Or your jar is full and it can
not install the deamon cookie BHLP. If it's ok, un-tick 'Hilfe-Dï¿½mon'.

If you see x and y coordinates with BubbleGem, the problem can be in the
translation of the rsc if the bubble help file is like Cab's.

BTW, if Alexander can explain how he build his hlp files... caus' I
don't understand the format: not a rsc file, nor an ascii file. I would
like to translate Cab's.

Bye,
/Pascal/

Yes, you're absolutely right. I wasn't thinking clearly. The messages
have to be converted from Atari charset tot iso-8859-x first. I did
provide a little program for that in one of the distributions, don't
know about the last one.

But forget it. It's too complicated.

with Magxdesk 4.00 and MagiC 6.0 the _IDT cookie is used to definethe date
format in Magxdesk and the system file selector. The cookie must be
set in the AUTO process.
Previous versions of MagiC ignore the cookie.

For showing the boot logo the VDI workstation is opened with device "1", which means "current resolution".
I do not know which resolution the VDI then uses, because the VDI was written by the Behne brothers. But I know that this b/w thing is a common thing with all Atari and PC versions
of MagiC.
Mainly I created the boot logo for MagiCMac, there it works fine.

> Anyone familiar with it?

At the beginning, 3.5" disks were pretty expensive, whereas the old
5.25" ones were cheap and available everywhere. That's why some
companies came out with these drives. The situation didn't last long, as
the 3.5" media became widespread. Not much use nowadays.

Cheers,
Nick

The Milan is another TOS clone, built in Germany based on a 040
processor. There will be an 060 later on. It uses a special TOS (4.5)
and a combination of MiNT and N.AES called MilanOS.

Source record: 97026

I finally got all the updates to work,- MagiC 6, very nice to look at.
NVDI 5, CAB 2.7, Emailer and FIFI.
Now comes all the translation work into danish, but thats another matter.

There is one thing that got me wondering, it`s CAB 2.7 and its new OVL file.
Why is it, that it didn`t show up in for ex. ShowStats.

With CAB 2.6,- Showstats tells you what browser you use, but not with CAB 2.7.
It just says Unknown to browser and Unknown to System.
Why is it so?

cheers

Joergen

surfing the net on a ATARI Falcon 030 with MagiC 6, - CAB 2.7 on I-Conn.

> I never had an atari st
> Can anyone tell me what is STE found in pacifist?
> thanks

An STE is one the machines in the ST (ST, STF, STFM, MegaST, STE,
MegaSTE) range. ST _E_nhanced. It was introduced around 1988 or 89 and
had stereo DMA sound, 4096 colours instead of 512, hardware scrolling, a
blitter chip, extra connectors, and a few other things.

The option in PaCifiST is supposed to enable a few of these enhancements
in the emulator. Some of the older games were not compatible with the
STE.

>It -still- hangs up on occasional items though when loading for offline.
>(Sting+MagiC+Falcon 40)

I've found a cure for this actually :-)

Make a note of the article number when it sticks, then press ESC, then open the newsgroup in which the sticking article belongs, now you'll see an index of the messages that haven't yet been downloaded, click on the first one, it'll stick again, but press ESC, and you'll find it displayed, click on next article, which will download and display. Now DISCONNECT host, let it clear, now CONNECT to host again, and read for offline. With a bit of luck the sticking message is already on your drive and following postings will come on down.

It usually works here for me. But occasionally I have had to quit and then re-run NEWSie after doing the steps above, but without logging off.

I'm using a Falcon, MagiC and STiK BTW.

I am just about to sell mine. But you're probably a bit too far away : I'm in Paris, France (and, anyway, mine is a 220 V AC 50 Hz, you would want a 110 V AC 60 Hz... Oh, well...

2944. STacy2 For Sale

Newsgroup: comp.sys.atari.st
Date: 1998-07-15 00:00:00 UTC
From: aa778@cleveland.Freenet.Edu
Message-ID: <6oi97k$4bn$1@alexander.INS.CWRU.Edu>
Source record: 97036

Atari STacy2 portable ST computer.
2 Meg RAM and 20 Meg internal hard drive
ICD Adspeed 16mhz CPU upgrade. Switchable between 8/16mhz
640x400 mono screen that is in good shape
720k internal floppy drive
Only real blemish is the "3" key is fussy at times
Ports for external mono and color monitors, MIDI, mouse, ASCI, serial,
parallel, and floppy drive
Comes with power supply and power cable

Asking $350 shipped anywhere continental USA.

2946. Multi ISP in STING

Newsgroup: comp.sys.atari.st
Date: 1998-07-15 00:00:00 UTC
From: mcooke@spirit.com.au
Message-ID: <6oi1id$f0l$1@hercules.spirit.net.au>
Source record: 97038

Hi All.

After a few hints I have finally set up STinG to use multiple ISP
accounts without chnging files and rebooting.

1 Remove all stuff from the DEFAULT.CFG leave only the vital stuff as
below

```
-------------------------------------
#
# This is the STinG relevant stuff.
# default config file
ALLOCMEM = 100000
#
THREADING = 50
FRAG_TTL = 60
#
ICMP_GMT = -60
ICMP_AD = 10
ICMP_FLAG = 0
#
TCP_PORT = 1024
MSS = 536
RCV_WND = 2832
DEF_RTT = 50
DEF_TTL = 64
TCP_ICMP = 1
#
UDP_PORT = 1024
UDP_ICMP = 1
#
DNS_CACHE = 64
DNS_SAVE = TRUE
#
#
#
DIALER = 127.0.0.1
LOGIN_BATCH = C:\STING\DIALER\LOGIN.BAT
#
---------------------------------------
```

2 Set up two or more files eg mine are apana.scr and spirit.scr with
all the necessary stuff for each ISP and chose before dialing which
set to use from the configs menu. Disconnect and chose the next
provider and dial. Works great.

Eg my script for one as below

```
#
#
# General Parameters Tyndale Apana
#
SERIALPORT = Ser.2/LAN
DEF_ROUTE = TRUE
MASQUERADE = FALSE
EXEC_BATCH = FALSE
CIX_LOGIN = FALSE
RESIDENT = FALSE
DEBUGGING = FALSE
#
#
# Port Parameters
#
CLIENT_IP = 0.0.0.0
MTU = 576
PAP_ID =
PAP_PASSWORD =
PROTOCOL = 1
VJHC = FALSE
LAN_PORT = FALSE
#
#
# Addressing
#
USERNAME = Pmcooke
FULLNAME = Malcolm Cooke
HOSTNAME = tyndale.apana.org.au
NAMESERVER = 203.14.230.14
NAMESERVER = 203.8.183.1

2947. Search for midi softwares & programmers for Ste

Newsgroup: comp.sys.atari.st
Date: 1998-07-15 00:00:00 UTC
From: CORNEILLIE Vincent <vcorneillie@wanadoo.fr>
Message-ID: <6oiaj5$60s$1@platane.wanadoo.fr>
Source record: 97039

Hello,

I'm a french owner of an atari mega Ste

1) ****** I'm looking for softwares for it *******

I'm looking for

TRAX Recording Studio Utilities
(Tracksheet plus)
by Quentin Rice
(c) Quinsoft 1990

I had a demo of this and I'll like to buy the full version.

(It allows you to print a cue list, a track sheet, a mix sheet and you can store the names and adress of the consummers and musicians in a database.)

I also looking for :
-'Studio module' for Cubase V3.0 Atari.
- Dr T's XOR (Universal Patch Librarian for Synth's sounds)
- other Editor/patch/Librarian witch is fully compatible with Notator/softlink and can manage sounds of Roland D70 and Yamaha SY99

2) ****** I'm looking for a programmer on Atari St********

2.1) If I can't find Trax (see above...)
I'll like to have a soft for manage a small recording studio

2.2) the 2nd software must be faster because :

It must be able to show 41 differents "midi control changes" on one screen like 41 bar graph.

The control changes are showing the moves of the faders of an automated mixing console Tascam M3700. For each fader (32+8+1=41) the console send 3 midi bytes like :

-in midi : Controlchange,fader nï¿½,Value
-in hexa : Bn,yy,xx where 'n' is the midi channel (0h to Fh), 'yy' is the number of the fader (00h to 25h), 'xx' the level of the fader (00h to 7Fh)
-in deci : 176+(n),yy,xx where 'n' is the midi channel (0 to 16), 'yy' is the number of the fader (0 to 41), 'xx' the level of the fader (0 to 127)

I tried with the cubase midimixer but there is 3 problems :

-1) The fist fader send a CTRL CHGE nï¿½0 and this is not reconize by Cubase
-2) Because of the size of the cubase's faders, you can't see 41 faders in the same time on the screen (you must scroll the bars)

-3) I already use midimixer's objects for FX programming and I can use only
127 object simultaneously

I don't know if some software for other mixing consoles can work (Allen &
Heath,
Soundtracks, Soundcraft ??...) I'm specialy thinking about 'Spirit Auto'
Software or 'big by langley'.

Thanks for answering to my email

I desperatley need to add my STE to my home LAN for the purpose of transferring large files to and from my PC's. I use TCP/IP over 10base2 (co-ax) and I really need some pointers:

Where net cards?
Where sox?
What spec/standards do I need ?

Cheers

Richard

>Small, very Fast, indexable, printable, you can cut/paste directly,
>organize all the HYP intelligently, supports pictures (even colors)
>etc.

Yeah. Great if you need screen dumps etc. I personally can live without 'em.
It's all very nice, but if people have to supply .HYP files then I just wish
they'd also include boring old .TXT equivalents too.
I don't care what people say, I *like* .TXT files. It's a personal thing,
and one that I've developed over the years being involved in computers.
I'm very cynical and just because it's *fab, groovy and new* doesn't make it
good. I like to print off a boring old .TXT with minimal fuss and read it
at my leasure wherever I like. I quite often take them into work and use the
office laser. Well I don't know (and don't want to know) of a PC program to
convert them! It's all down to laziness really (as someone else said in this
thread). I *don't want* .HYP documentation. I *like* .TXT docs.

Other people have said it's 'easy to convert 'em to .TXT'. Is it?
Can't say I've done it. Then again, why should I have to?
I also get fed up with some .HYP's that seem to tell me to 'try the latest
ST-Guide'. Pisses me off. AFAIK I *do* use the latest. ST-Guide *isn't*
supported anymore. Or is it? I have the latest *English* version.
Interactive is a waste of time IMHO. They are about 18 months out of date.
Joe Conner, where are you???? I tried to get a English version of Bubble-Gem
out of Thomas Much, to be told 'try Interactive'. Yeah right :((((

>Besides, if your system is quite well setup. For new software, When I
>install it, I will just copy the new HYP file in the main stguide

>where I want it to be. Have a prob with a certain window from THING
>program? click on HELP, and boom, the HYP file loads exactly where you
>need it, exactly what you needed.

If you need online help, fine. Personally for Atari software I think it's
over rated. I know my way around Atari's and haven't yet wished for online
help. Windows etc. is a different story ;-)

>Anyway. That's one of the best thing we have imo for atari. Besides,

Totally *disagree*. If that's 'one of the best things' on the Atari
platform, then it's very dire indeed. Hypertext help is a nicety, it's by no
means *important*!! Decent functioning software is *what's important*, not
flashy *help files*. :((

>MAC also can read directly HYP files directly, and I heard Amiga,
>(altough Amiga reader can't read directly the HYP file, need to
>recompile it from the STG file).

Whoopy! I sold my Amiga 5 years ago, and have never had acess to a Mac.
So this is *hardly* a selling point :(

>Anyway. Much more convienient than TXT files in any ways.

Nope. Not at all. I can take my .TXT file in to work and print it on the
laser. Then I can read it whenever I like.

>Btw where are you going in FLorida? where at precisely?

If I go, it will be Lakeland. Between Orlando and Tampa. It actually got a
mention in the X-Files a few weeks ago, which surprised me.
I worked there for 5 months about 3 years ago. This time it will be on a
contract basis for a year.

Exactly. I too am lazy and don't mind admitting it :)

I much prefer .TXT files and am proud of it. Supply .HYP files by all means
with their imbedded images etc. but *at least* supply a .TXT version of the
manual too.

Also, AFAICT ST-Guide ain't supported anymore. When was the last English
version?? Relying on unsupported software IMHO is a *bloody big mistake*.

>greets, -micha-

Because it's a *personal* thing. I *hate* them. It's as simple as that.
Telling me I need to get hold of *another* program to read some docs, is
taking the p**s. It's becoming more and more common on PC's too. A lot of
docs these days assume you have WORD. Well, what if you don't?
TBH that's a different scenario. *Most* PC users *will* have Word. But you
really can't say the same about Atari users. ST-Guide's *only* purpose is
to translate .HYP files. Big deal. Word is a useful program, whereas
ST-Guide's use is limited to one single purpose.

I am of the opionion, that if an author *wants* to supply .HYP docs then
fine, but please also supply .TXT equivalents.

I am looking for an Atari 1040STE computer.

I am in the southeastern US.

Thanks,

Roger.

Before Dawn should work, atleast it did in all resolutions on my
Falcon the last time I tried it.

>Is anybody left in North America who can upgrade the RAM in the TT? I

I'm not sure, but you could try contacting Best Electronics.

>understand that the memory is not configured with standard SIMM slots. Am
>I wrong there?

The ST-RAM boards (the one to the right, below the harddrive) doesn't
use SIMMs, but there's no point in upgrading ST-RAM anyway. Some of
the TT-RAM boards (to the right) does, but if you have a 4Mb card then
it's most likely that it either use SIPs (soldering required) or that
it can't be upgraded.

The easiest thing to do is to get the aixTT (www.aixit.com) which can
be fitted with one or two 72-pin SIMMs (upto 256Mb with the new
version, 64Mb with the old). I have one with a 32Mb EDO-SIMM fitted
and it works very well. It's not too good at auto-detecting how much
memory you have installed, so you might have to solder a wire to get
things right.

Absolutely. You need at least the STING.CPX to activate STinG.

The AUTO folder stuff SHOULD really run in the auto folder before anything
else. The correct order is DRVIN.PRG, MFP.PRG (assuming you're running a
stock ST), STING.PRG. Why don't you run them from the AUTO folder ? Use a
boot manager if you don't want them to load each time.

XControl.ACC runs perfectly well on all machines, even the older ones. You
can run it as a .PRG too if you are afraid about memory, but you HAVE to run
it, as it will only activate STinG when it loads the STING.CPX.

Cheers,
Nick

Get Pacifist. It does work, but many people fail to get it running because
they don't read the docs correctly. The link is in the Quick FAQ.

Thank`s for the offer, but I got it up and running now. Very nice desktop, don`t you think?

Don`t really know what happen, but I made a second try, and moved some file around a little before rebooting, and then it works.

I use this little boot prg. and some of the files have to be in my Config folder and not in the Auto folder.

I did have a minor problem with cookies and CAB, but I guess it will work out to?

cheers

>
Yes, that's what I do. I end up with the copy read on-line in WORK,
which goes away when I delete current entry, and the original in
OFFLINE but with no entry in the index XOVER.TXT corresponding to it.
Occasionally I compare XOVER.TXT with the actual files in the NG folder,
and delete the ones which aren't referenced. I wouldn't call it a cure,
more a work-around, and it does mean that I have to sit at the keyboard
whilst it's downloading instead of letting it get on with it, and it
roughly doubles my connect time and subsequent telephone bill.

It's a pity Newswatch doesn't seem to be Newsie-compatible: Popwatch is
an excellent complementary package for email control.

Hi Neil

the home folder is for the cfg and info etc.. files. Most of the new
programs use this folder to store these files instead of all over the
place. Also in the user folder put a default folder as some programs
look for this to store there config and info files!

Magic Inf should look like this,

Hallo Atari-Freunde!

Ich suche seit langer Zeit das legendaere Spiel "esprit" von Meinolf
Schneider aus dem Jahr 1989.

Entsprechende Bestellungen bei "Application Systems Heidelberg", der
damaligen Vertriebsfirma und bei "digital art" und "dongleware", den
Vertriebsfirmen der Nachfolgespiele "oxyd", "oxyd2" und "oxyd magnum"
wurden selbst nach mehreren Anfragen nicht einmal beantwortet.

Deshalb meine Frage an Euch!
Wer kann mir dieses Spiel verkaufen oder mir sagen, woher ich es be-
kommen kann?

Herzliche Gruesse
Wolfgang Hermesmeier

It's where quite a few utility programs expect to find their config.
files etc. Most will look in their 'current' directory as well so not
having $HOME will generally not cause failure.

There is a discussion of why $HOME is used in the START.PRG
documentation. I don't think I'm totally convinced but since I have
set up this path quite a few progs. have 'nested' there.

I know SMF-play, it works but hogs the CPU... I've found some other players on Hitsquad's site though, including a fairly new one that might work.

Those are regular AES messages. 1E is WM_UNTOPPED and 48 is SH_WDRAW.
The first one is probably the AES responsible for and the SH_WDRAW
is probably sent by another application for some reason. It's nothing
to worry about.

hi neil,
AFAIK, EASE 5 has this option. (or am i wrong? but i think so, BTW, ii¿½m
using EASE). perhaps the JINNIE desktop does it, too, i doni¿½t know, have
never seen it...

2986. SC1224 color monitor for sale

Newsgroup: comp.sys.atari.st
Date: 1998-07-16 00:00:00 UTC
From: jk@panix.com
Message-ID: <6okr1c$kk0@panix.com>
Source record: 96866

SC1224 color monitor, including cables, $20 plus shipping -- pick it up in Brooklyn and save on the shipping. It works fine and is otherwise in good condition. If you don't feel like paying $20 make an offer, whatever you think is reasonable. The minimum will be shipping plus something to cover the trouble of packing it up and sending it to you.

2988. Atari Printer Compatability Question

Newsgroup: comp.sys.atari.st
Date: 1998-07-16 00:00:00 UTC
From: newyork999@hotmail.com
Message-ID: <6ol0ef$h6d$1@nnrp1.dejanews.com>
Source record: 96868

Greetings Fellow Atari Users,

I have an ATARI 1040st which I use for music note printing and word processing. I have circa 1.5 ram meg and no hard disk.
I would like to connect this Atari 1040st to a new OKI 4m LED(laser) printer which has ports for both PC and Macintosh computers.
Can this be done?

(At the moment I am using an OLIVETTI JP150W bubble jet printer and it is very slow and the lines are sometimes not sharp.)

Please answer as soon as possible.
Mega Thanks.

Respectfully,
newyork999@hotmail.com
Gothenburg,Sweden

Makes since now. I was getting a dialog when clicking on ENABLE from Sting dialer saying "Aha! Sting not enabled yet". I presumed it was enabling it because it would then allow me to issue the connect. I will play with the XControl. I havent been using a manager becuase of limited memory and only want this stuff active when I need it.

I'll post what I find.

Thx!

First, try a disk repair utility to find FAT errors.
Second, I would try an alternative Shell like Gemini or Thing.
If the problem goes away, your version of Magxdesk possibly
has a bug.
If the problem remains, try to change the hard disk driver. Try
HDDRIVER.
If the problem further remains, try a newer version of MagiC.
4.02 is so old that I cannot remember what bugs it had.

Put the HSmodem files in the auto folder along with the some of
the STinG files and have the control.acc set up with some of
the STinG files in it too. They all must work together, right
now your missing part of the needed steps.

After installing XControl and placing the CPX's active, I am able to connect to my ISP now. I can resolve names, ping successfully (send and receive), and traceroute works. Now the only snafu is that CAB doesn't work. I've cleared the cache, and verified the proxy settings (None). I can enter a URL, cab shows a dialog about resolving, then formatting text, and a blak page is displayd. During this time, no modem activity occurs. If I exit CAB and run ping or traceroute, etc, those work.

Does this sound like a proxy server setting not being correct? I setup no proxy under a Win95 machine for the same ISP. The route table shows something like this (left to right):
"first field defined" (something in it, cant remember what (ip?))
nothing in second field (netmask?)
third field is "Modem 1"
last field is "--" (Gateway)
Does the gateway need to be defined?

Any ideas?
Thanx in advance!

>Even with the same OVL file.
>
>I was using the OVL file from CAB 2.6.

Interesting. When you click on reload while online does CAB 2.6 load
the graphics from your RAM cache or does it load them from disk? In
the 2.7 demo it loads them from disk, which is /very/ annoying. I
wonder if it's related to the ShowStats thing. (I'm not sure if I've
tested CAB 2.5 with ShowStats.)

>BTW, what happen to the cookies?
>There was some talk about this a couple of weeks ago, but what was the results?
>
>Before installing MagiC 6, I had no problem reciving cookies. But they never ask
>anymore, and there is no cookies to see??

Hmmm...I don't know. They seem to work for me with MagiC 5.11 and
the CAB 2.7 demo. (Wish I could buy MagiC 6. :)

Yes, EASE 5 has that option. Neil has EASE 4, but I'm not sure if
that has it or not.

I don't believe Magxdesk does. (Heck, it doesn't even have non-modal
dialogs, and it's multitasking shell!)

In what way would it be used for that purpose? Are you saying people
get your URL from there and then go to your site to get your email
address? That seems unlikely. If it's true, I haven't noticed any
increase in spam since signing up.

3008. help: disable internal floppy

Newsgroup: comp.sys.atari.st
Date: 1998-07-16 00:00:00 UTC
From: Liam Busey <anonymous@ix.netcom.com>
Message-ID: <35AE5C85.1561@ix.netcom.com>
Source record: 96888

Hello everyone, I was wondering if someone could answer a question of mine. I've a 520STFM with one of the old single sided double density disk drives in it and an external double sided double density drive. My internal drive is kind of flakey and only works about half of the time. Is there some way that I could disable the internal drive and and boot from the external? BTW, I'm not afraid to mess around with the computers internals. Any help would be appreciated.

Liam Busey

```
you could buy a common pc hd disk drive. there is one pin you can
change to make it a dd drive, but i don't remember which, ask around.
then you can plug it in place of the old one. btw it won't do 82
tracks or 11 sectors very well but it's better than one which won't
work.

or, you can use some auto-folder program that assign drive b: as a:
after reset or from auto boot, but i don't know where it is available.
:)

Hi Ronald,

nope, doesn't work here. Just moved old prefs.inf from where it normally sits, then saved prefs again, started up again and positions still as they used to be: not what I set them to before saving prefs.

Another bug (had this with previous versions too) is: in a certain ng the last received posting is nr. 637 (just an example here). When you look into the Default.grp later, this sometimes shows 638 (which is OK), but on numerous occasions it will show 637, 636 or 635, resulting in fetching the same article(s) on the next connection. It means everytime after a session I manually check/edit the Default.grp to avoid this. It happens all the time in CSAST, in groups with less flow most of the time the number set is OK, but not always...

Maybe this is obvious, but so far I haven't found out how to do it.

I see in many of the posts here that in addition to displaying (in the message header) the usual info: Subject, Author, etc, some headers display the hardware and other system information.

For example:

"X-Newsreader: NEWSie Version .88 (Atari)"
"X-System: Falcon030"
"X-Internet-Software: STinG CAB 2.5"

(etc.)

I'm assuming there is a config. or .RSC file that has been edited to show this information. If so, which is it?

Yes, both the BubbleGEM CPX and BHLP cookie are resident. Deselecting
'Hilfe-Dï¿½mon' stopped those funny messages -- thanks for the tip.

> If you see x and y coordinates with BubbleGem, the problem can be in the

But FireNews doesn't support BubbleGEM, so it's not related to the rsc.

If I do a cold boot without BubbleGEM resident, or disable it through the CPX, the random AES messages in GrafTool and FireNews disappear. All this under MagiC 5.11 and BubbleGEM 7. I'd say it's BubbleGEM ;-)

From: ecncomr@socal.com
Message-ID: <6ojr35$332@enews2.newsguy.com>
Source record: 96925

I've just upgraded NEWSie to version .90, and I think I found a bug.

It's not saving my window size preferences - at least not ALL of them.

The GROUP window opens where it did before, and the OVERVIEW does too, but when the individual articles come up in their window, it is only about 1/3 the size it should be. I've resized it to where I want it, and saved PREFs, but the next time I read an article, it comes up 1/3 size again. Any thoughts on this?

3019. WTB: Emagic Logic for St

Newsgroup: comp.sys.atari.st
Date: 1998-07-16 00:00:00 UTC
From: six-sun@speakeasy.org
Message-ID: <6ojsv9eff1@betty.speakeasy.org>
Source record: 96926

Hello all,

Does any one have the last version of Logic for the ST that they would
want to sell ?

.Arik.

3020. NEWSie .90 Bug (part 2)

Newsgroup: comp.sys.atari.st
Date: 1998-07-16 00:00:00 UTC
From: ecncomr@socal.com
Message-ID: <6ojrn3$5ss@enews4.newsguy.com>
Source record: 96927

I just posted about a problem with NEWSie not saving the window size correctly in version .90. I've determined that it does save the width correctly, but the length is not saved (with ARTICLEs window, as well as with the ADDRESS BOOK).

What's the deal?

3021. WTB mint cond HW, Calif, US

Newsgroup: comp.sys.atari.st
Date: 1998-07-16 00:00:00 UTC
From: Lew Jenkins <LewJenkins@home.com>
Message-ID: <35AD8879.93A2B6D3@home.com>
Source record: 96928

Any 1040 or upgrade 520 or other Atari HW in MINT- Like new cond?

Also looking for C compiler w/doc for Atari.
Any good IDE (do they have a C IDE for Atari ?:)/compilers for Atari
that someone might recommend?

BTW: I tried a couple of the emulators (I forget which ones) w/o any
success, does anybody know of a easy to use, simple SW AtariST emulator
for dos or win or ? that they could recommend, I guess it's probably not
likely for me to get copy protected games (Arkanoid/Oids), or SMPTE Mate
to run on a PC eh? Or any PD source code for Atari Shell on a PC?
-lew

Thanks for the reply, I have fixed the problem.
My example wasn't really illustrative of what I wanted to do -
my intended application wasn't to write out printable strings, so
that's why I was using fwrite(). (I'm actually trying to write some
dev tools for the PalmPilot PDA.)

I found that fwrite() works fine if I fopen() with a mode of "wb". That's
OK, since I'm writing binary data. I'm just curious why I couldn't even
write printable ASCII without the "b" flag. Perhaps it's something to do
with my setup (TT/030). Without the "b", the data written had no
resemblance whatsoever to the data I was pointing to.

Thanks again,
-Russ

Aha! Thanks. I knew I'd seen it somewhere. Was driving me mad! Still
can't figure out why its not in my header files though - I've written
stuff that supports BubbleGem!!!

>I've
>seen the same thing. If I disable BubbleGEM, the messages don't occur.
>FireNews is also affected: everytime the mouse is moved a dialog appears
>showing its x and y coordinates (very annoying).

That must be some test code erroneously left in FireNews. I've located
my code now. Needs modifying slightly but it's clear enough with the
comments I've added ...

```
#include "pugg.h"

#define BUBBLEGEM_SHOW 0xbabb
#define BUBBLEGEM_ACK 0xbabc

bool
pug_bubblegem(wd,wdi,x,y,s)
PUG wd[];
int wdi;
int x,y; /* mouse position */
```

```
char s[]; /* string to display */
{int msg[8],
b_apid =appl_find("BUBBLE ");

/*?exists?*/
if (b_apid < 0) return false;

msg[0] = BUBBLEGEM_SHOW;
msg[1] = wd[wdi].wd_apid; /* ie from yer appl_init() */
msg[2] = 0;
msg[3] = x;
msg[4] = y;
msg[5] = (ulong)s >> 16;
msg[6] = (uint)s;
msg[7] = 0;
appl_write(b_apid,16,msg);

return true;
}
```

BubbleGem replies with BUBBLEGEM_ACK at some point but this can easily be ignored.

3030. Problems with ZIP-drive solved.

Newsgroup: comp.sys.atari.st
Date: 1998-07-16 00:00:00 UTC
From: cwesterh@dds.nl
Message-ID: <35adaa43.895689@news.utrecht.nl.net>
Source record: 96937

In November I wrote I had problems with my ZIP-drive. I ruined my
harddisk completly. It was thought to be a problem with terminators.
Well, this was not the case. IT WAS THE CABLE OF THE ZIP!!! This
proves again that problems can be where you do not expect them at all.
A few years ago I had something similair. I bought a SCSI-drive for
not to much money and did not manage to get it working. A company
solved it for me. (It did only cost more then I paid for the HD. %-<)
What was the problem? They put in 'terminators'. The only problem was,
they looked like terminators, but they were not. That's live, I am
afraid.

Cecil.

Hi,-
>
>I don't have a Web page (does everyone on the Net need one?), but I did
>click on Showstats "sample" and it did show my ISP and CAB as the browser.
>It did show my operating system as "unknown". If someone is using CAB,
>I guess one could assume it's an Atari.

No,- you are right, most don`t need a HP. I got my HP mostly because my IP let me have 10 mBytes on the server, it`s part of the deal.
My guess is, that more than 50% are just for the fun of it. Mine is, and it also gives me a chance to show the rest of the world, that there is a alternative to the Intel/Micro$not boxes. Many has done that better than me, it`s just my little contribution.
You and I know that a CAB user most certainly is a Atari user, or Hades/Medusa/Milan. But others don`t know that. Think of all the ignorant people out there. <G> One of the main reasons I have all this Atari banners and references all over my pages.

>I'm using CAB2.71 and Ackerman's OVL emulating Mozilla. Curious why anyone would >want all the detailed info on who's "looking" at their Web page <g>.

It`s just that, curiosity. I don`t have any real use of this information, but I don`t have a cat. <g> And I`m now using the OVL file from CAB 2.6. That works.

From those that wrote in my guestbook, I already know that the visitors come from all over the world, Australia, USA, England, Germany, Austria, Holland, Sweden, Norway, but the ShowStats gives me a little info about the rest of the visitors.

>Sometimes I wonder where we're going with all this Web stuff. CyberWork, CyberLife,
>CyberMind, and CyberState. CyberState, I like that one <g>. Ex., Sometime
>in the near future, two Web geeks connect: "Where are you from?", "I'm from
>CyberState Atari"... Just some SciFi stuff. Only time will tell...

CyberState Atari,-- I can imagen that.<g> It will be, when we finaly have "ATARI" computers powerfull enough to handle avatars. That`ll be the day, when your avatar goes to a TAF meeting,- a Neuss Computer Fair or even visiting me at my home together with the rest of the Atari community. As it is CyberSpace, there is room for all of us.
My avatar will be like a danish "roligan", (the danish football/soccer fan), paintet all over in national color with a Fuji logo on the front and the rear, or perhaps a Milan logo.

cheers

Just made a little test with CAB 2.6 and CAB 2.7, with the same OVL file.
The results are not the same,- not from what I see.

CAB 2.6 load the page from the server, while CAB 2.7 take it from the cache.
Even with the same OVL file.

I was using the OVL file from CAB 2.6.

Must be something Alexander have to look at?

BTW, what happen to the cookies?
There was some talk about this a couple of weeks ago, but what was the results?

Before installing MagiC 6, I had no problem reciving cookies. But they never ask
anymore, and there is no cookies to see??

Ooops, Louis...my fault-guess I should have made it clearer-I also quit
out of Newsie after deleting the old PREFS file, then restarted Newsie
before saving again. Try it like that, it sure worked for me. What gave
it away for me was that with the old PREFS, I was saving positions, then
noticed that the size of the PREFS file was not changing. With the new
PREFS file (after restarting!), it went up in size everytime I added any
thing and saved. Hope this helps, it did the trick here. See
ya! ;-)

Just curious...

I'm about to (finally) get MagiC 5 for my Falcon, and I currently use ICD Pro HD software (version 6.5.5). Anyway, I know MagiC will work with the ICD driver, but what _won't_ I be able to do with it? I have heard that certain background "activities" are only possible with HD Driver. But is this the only thing that ICD can't do?

Also, if I decide to switch to HD Driver, what is the latest ENGLISH version, and do I have to reformat/repartition the drive in order to get the most out of HD Driver?

A while back, someone here (I forget who) was looking for some Atari BBS software. Well, the best Atari BBS software I ever saw was made by a guy named Brian Hauer. He used to run a couple of Atari BBSes in Southern California a few years ago. He was also co-author (and friend of) Aaron Hopkins of Freeze Dried Terminal fame. Anyway, he's always been an excellent ST programmer, and he wrote this BBS software a while back, and used to use it on his system. It's called Foresight, and it can be found (although I'm not 100% sure it's the latest version as I haven't spoken to Brian in a while) on the ftp site below:

wuarchive.wustl.edu/systems/atari/umich.edu/Telecomm/Foresight

I believe the file is called "FS_WB2.ZIP"

Hope this helps whoever it was that was looking for Atari BBS software!

Classic question number 2: Which CAB.OVL are you using ?

It's always recommended to use the latest one from the author's homepage.
The URL is in the Quick FAQ.

Cheers,
Nick

Just swap the drive mechanisms. You'll need to set a jumper to change the ID
number, but other than that, it's a simple plug'n'play job.

The English and German binaries are always identical, i. e. versions and
features don't differ. This is because all programs are bilingual. They
use the German or English language, depending on the language TOS
indicates. The latest version is 7.54.
If your drive doesn't have more than 4 partitions repartitioning is not
necessary. Otherwise it depends on how you partitioned your drive.
Especially old versions of the ICD software didn't create the format
documented by Atari for more than 4 partitions. If this is the case
ICD2AHDI (included in the HDDRIVER distribution) will change the format
with losing data.
Have a look at the demo version of HDDRIVER for more information:

Hmmmm... is this such a good idea, to ignore the BUBBLEGEM_ACK that is?
As it's your app which allocate memory for the string sent to BubbleGEM
you can free or change the string whenever you want, BubbleGEM will
read just junk. You are only sending a pointer to the string so you
realy need to wait for BUBBLEGEM_ACK before you do anything with the
string to be on the safe side.

Ease 4 supports dialogs to the mouse position, but that's not what I meant. What I meant was how does one make the 'system' (MagiC's AES) tell applications to have dialogs follow the mouse instead of centered? Geneva's AES handles this rather well... I just thought it would be possible under MagiC. Maybe the idea is that applications themselves should decide whether there's a need for that (like Ease). But a large monitor (like the TTM195) dictates the use of something to have dialogs near the mouse.

Jos

I'd just like to publicly say a big *thanks* for putting my suggestion or saving the message-id of articles in so quickly. :-))

I've just tested it by assigning Alt G to the command save-mid and it works a treat. Dead easy to now download whole articles where you have previously just retrieved the header, using NEWSwatch and NOS's GET file format.

For people out there who use NEWSwatch with Okami, then get hold of the latest beta135.zip from Jos's web site, and see what I mean :-)

If the TIFFs are in CCITT-compressed format, like I think most faxes are, one is going to have trouble viewing them with a graphics program. At least this is my experience. That particular flavour of TIFF seems to be the domain of fax programs.

Don`t know if there is a big difference, but WDIALOG has been added into
MagiC 6, you don`t need that anymore. Besides that, it`s mostly cosmetic, from what I see.

You can use vector fonts as systemfont.
A new windowmanager.
Option of 3D menu and submenus.
MGSEARCH is Year-2000-compatibel
MGEDIT with scroll bars.
Very nice borders on almost anything, desktopwindow etc.

That`s about it, or at least what I see.
cheers

When COMPO were alive and well, they sold 2 CD-ROMs of Speedo fonts to go alongside (amongst other things) That's Write 3. TW3 is IMHO a great program but I missed out on the CDs just before Neil and his team hit the wall. I also admit to not wishing to pay ukp 50.00 each for them.

Does anyone have these CDs and might be prepared to sell them at a reasonable figure? The fonts were I think also on disk but I would prefer CD.

TIA

Cross-posted to: alt.atari,comp.sys.atari.st,comp.sys.atari.st.misc,comp.sys.atari.st.tech

Anthony ... welcome back ... lots has happened since the TOS platform supposedly
'died'. Some personal highlights from the current state of play ...

* numerous TOS clones, Hades, Medusa, Phoenix, Milan, C-Lab Falcons
* TOS emulation for PC, TOSBOX, Gemulator, Pacifist
* *STILL* lots of new software of high quality
* Music technology magazines 'The Mix' and 'Sound on Sound' *STILL* carry 2-3
pages every month devoted to Atari ST (that's nearly 15 years since their
introduction)!!
* STe can now take IDE drives (TUS developments)
* 68020 based 16 and 24MHz accelerator card with TT fastram for STe (TUS dev
again)
* Ataris happy with new generation of SCSI devices, ZIP drives etc
* TOS has an excellent web browser called CAB, supports frames and forms etc
* Hardware MOD to serial port available for modem speeds up to 128k
* New printed mag in the UK, 'Atari Computing'
* ST is *STILL* the computer of choice for the budget conscious MIDI musician
* New interface allows up to 14megs of memory on standard STFM (not STe yet)
* Thriving on-line community

Pretty lively for a 'dead' platform!

Viva Atari,
Jim.

> TXT file as well.

youï¿½re right. that would be the best way to go. everyone can do it his
own way, everybody is pleased.
and of course, for learning a program i would prefer a txt-file, too.
what i meant was, st-guide is very comfortable as a HELP server progy -
and i think that is itï¿½s "destiny" ;-).

at least, txt can be read on EVERY system - even on a PORTFOLIO, if it
is not to big!!! thats a great advantage, too.

greets, -micha-

hm, i remember i had problems with the new NVDI printer CPXes, too. but
in my case it depended on the COPS version. when i replaced the
installed version of it with the new one delivered with NVDI, suddenly
they worked.

i doni¿½t know exactly if that is what you meant with "no access to the
NVDI printer panels", but just a try will make sure...
sorry i cani¿½t help more for now.

Hi!

Since version 2.x the main simple VDI functions have been improved only a
little AFAIK.
The big differences between the different versions consist in the
additional functions, such as SPEEDO font handling, (color) printer
support, MagiC support and so on.
If you use NVDI 2.0 on a bare ST with perhaps only one meg of RAM, keep it
and be happy, NVDI 5.x will take much more RAM...

So long,

>
Sorry, no. I dont check the email address this originates from (SPAMmers and all). I did however get it working (more or less).

It seems now, I can use FTP, TELNET, PING, TRACEROUTE, POP3/SMTP, however I cannot get CAB 1.5 to view HTTP nor NEWSie .88. When opening URL's in CAB (with overlay) I get a message saying "resolving name", then formatting text but it comes back blank. There is also no modem activity. Same thing happens in NEWSie when opening URL. I thought it might be proxy related, but a Win95 machine configured for the ISP does not require any proxy settings.

Maybe I just cant get the Atari on the net (at least my 1040 STF anyway). I would so love to MS free!

Any further advise?
Sidney

> Roger Cain, Manchester, UK NeST:90:100/103

The version of CAB is 1.5. The version of the OVL (I think is 1.29). I tried two different ones by placing them in the main CAB directory. One causes the message "Error reading address - invalid character /" or something to that effect, the other just goes blank as described. I also tried placing in the MODULES directory, but notice no significant difference in operation.

Confused? I am...

3070. ScanX & Microtek

Newsgroup: comp.sys.atari.st
Date: 1998-07-17 00:00:00 UTC
From: Micha Knorpp <micha.knorpp@bk.bosch.de>
Message-ID: <35AF5B09.E65E5481@bk.bosch.de>
Source record: 96789

hello everybody,

ii¿½m having troubles with ScanX on my Microtek SCSI scanner. got it to work one week ago, but it seems to have problems.

sometimes the scanning process starts with calibrating the scanner, and at this time it stucks until timeout.
at other times, calibrating is done, the scanner starts to work and, after a few millimeters, it holds and a message is displayed, saying "ERROR on read 0". or a message is written directly to the screen (into the menubar), saying something like "Fp error saving tag file" (or something similar, i canï¿½t remember exactly at the moment).
what does this mean? maybe "Fp" = filepointer ???

this happens in all resolutions (i mean, screen rez). i know i have trouble swith the SCSI-port on my F030, but this message is very strange to me. could it be a bug in the Scanx-SW ?

has anybody made similar experiences?
BTW: ii¿½m using HDDriverï¿½s alternative SCSI-routines.

another question: how can i tell Scanx whether to store a picture in IMG or TIF format (i think this are the only ones which are supported)? or is this done automatically?

thanx for help, -micha-

> ya! ;-)

Hi Ronald,

well, I must have fetched the NEWSIE90S file, where the S stands for
Stubborn... your method described above didn't work either....

Come to think of it: my standard set up is on a SVGA monitor running 832x608
in truecolor. The monitor went into repairs some time ago and I hooked up a
bloody VGA paperwhite, so now I'm running in TT-med, 16 grays. This monitor
won't do the trick on my card.

Ever since, Newsie wouldn't save the windows positions, where it did before
(I set up the whole bunch running in this TC mode, then saved prefs). Of
course I had to re-adjust some windows running in this 640x480 mode, and
from then on Newsie wouldn't listen to me any longer...

Well, hope to see my SVGA back shortly and will see what happens then.
Tks for the input anyway.

>
Hi folks,

well I agree and I don't... Sure, every decent operating soul should read
the docs before even touching a program, but we're all not decent souls,
hence cryptic stuff like RTFM has been invented.

It's true, I do print out lotsa docs, but the bloody thing is, when I'm
running into trouble, where's the bloody printout???

Gawd, have to leave the program, get into the texteditor and find/locate the
docs for it, somewhere on my 1.7 Gig drives. Were they still in the archive,
or were they... heck, where ARE they?

Glad I've got MagiC (so can start up the finder/reader/unarcher parallel),
and sure glad I have ST-Guide so I can just hit the bloody HELP!!! key and
get straight to where I have some trouble.

BTW Gary, what's the other features/purposes your program offers?

I have a complete Mega ST4 system and a TON of software for sale. Sale is open to all. I would prefer to sell the whole package as one lot, but will consider offers for individual pieces of software or hardware.

Package Price: $400 (US)+freight, or best offer. Inquiries should be directed to:

WFChris@aol.com

The package includes the following:
Hardware
1 Mega ST4 & Keyboard
2 Monitors; 1 SM124 momchrome & 1 SC1224 color
1 monitor switch box
1 mouse
1 joystick
1 MouseMaster switch box
1 ICD 44 mb Syquest drive
1 SF314 external floppy drive
1 Cannon BJ10e bubblejet printer
1 Supra Modem 2400 (ok, its not very fast, but it was good enough for GEnie)

Software
Applications
Calamus v 1.09.6 & 1.09N
Flash
Clean Up ST
Word Perfect
Degas Elite
Data Manager
Word Flair
various utility programs such as NeoDesk

Games
Maniac Mansion
Empire
Star Wars
Gauntlet
Warlock
ArcticFox
King of Chicago
Thunderbirds
SimCity
Ancient Art of War in the Skies
Steel Empire
ShadoWorlds

Balance of Power (1990 ed)
Rorke's Drift
Railroad Tycoon
Storm Master
Populus
Power Monger
War in Middle Earth
Defender of the Crown

> or on some gargantuan homepage where one gets lost in an eye-blink.

There is an archive called SMC_TT IIRC, from Ulrich Roerl (sp?).

It describes how to hook up an SMC ultra card to the TT VME bus, including
schematics and driver sources.

The VME bus is neraly identical to a 68000 bus, at least the crippled one
used in the TT.

I made a PCB based on that idea which fits neatly into the VME slot with only
2cm of the Ethernet card looking out - no messy cables and external card.

Using a hacked version of the TUW soft, I get between 100 and 300 KB/s when
doing ftp - I still have no MiNT driver.

(I get the same performance in the Milan - so I guess that the TUW soft is
the limiting factor, not the hardware. I can move data to/from the card in
the TT faster than 3MB/s IIRC).

Hi Charles

A Avatar is a 3D virtuel figure i CyberSpace. FWIK it`s a UK based company that has made it happen, a virtual world, where you can create your own 3D figure, control it from home, but go visiting other avatars in this 3D world. Singing, dancing, what ever you like.

It`s not a avatar in the normal way (a divine incarnation), but rather a figure that you can create from your own imagination (small, big,- what ever).

From what I have seen in the TV (Computer Cronicle on NBC and our local TV1) it looks like someting that can be exciting someday. One of the developers told to the TV that there is about 5000 avatars to day, but more will follow.

Very cool. Props to Jos.

Is there a way to assign a command to uudecode an article that I'm
missing? It's somewhat of a hassle to decode several messages in a
row, because there are so many steps involved. Even if it
'remembered' your last save message options, that would be helpful,
so you wouldn't have to click on uudecode every time.

My external is a third party drive and uses a standard sized 3.5 floppy mech which is much smaller than the one in my ST. It may be compatible but I don't have a clue as to how I could safely secure it inside the case. I don't want the new drive to slip and short the motherboard. Does anyone who has experience with this sort of thing have some pointers that they could give me?

Yep. I think maybe I went a bit far saying I *hated* them (bad day at work and all that). I can see their use in an online help mode, but certainly for learning a program .TXT is much nicer. So I think I'll stick with the 'prefer .TXT, but please can authors supply both .TXT and .HYP files, if possible' :)

>at least, txt can be read on EVERY system - even on a PORTFOLIO, if it
>is not to big!!! thats a great advantage, too.

That's one of my main reasons for prefering TXT as I've already said :)

>get straight to where I have some trouble.

Fair point :)

>BTW Gary, what's the other features/purposes your program offers?

What program would that be? POPwatch? NEWSwatch? CoSTa? etc. etc.

POPwatch can be used to send/retrieve email in Oasis2, NOS, Okami and NEWSie
format. ie. using them as the offline part and POPwatch with STinG as the
online part.

NEWSwatch can be used to send/retrieve news in Oasis2, NOS, and Okami format. Similar to above.

CoSTa costs and keeps track of all Comms calls via various Atari comms packages including STinG, STiK, CoNnect, etc.

Visit my website for more details on all my stuff. :-)

There may be another way round this. I've set the time-out delays at 30
and 15 seconds. This seems remove the 'hanging' that sometimes happens.
Not sure as to what causes this 'hang' but it seems to be when it receives
a '.CR/LF' at the end of a message.

> It's a pity Newswatch doesn't seem to be Newsie-compatible: Popwatch is
> an excellent complementary package for email control.

Ah. There is a way to use NEWSwatch for news with NEWSie, I use it myself.
The problem is the program is in GFA basic and I've not had any luck in
compiling a working version. Not sure why but I think it could be some
bug inside the library. Anyway, as an interpreted program it works nicely,
even if it's a little slow.

It's located at:

<URL:http://www.my-ste.demon.co.uk/files/do_files.lzh>

If you haven't got the basic interpretor, I can supply the run only version
to use instead.

On Thu, 16 Jul 1998, Gary Priest wrote:

>convert them! It's all down to laziness really (as someone else said in this
>thread). I *don't want* .HYP documentation. I *like* .TXT docs.
It seems you are really missing the point. Do you understand the
concept of speed or size?
A 40kb HYP can be like 300kb HTML. How about the speed?
That's the whole idea.
Also when jumping from one section to another. VERY handy. A TXT
doesn't cut it there.
I didn't say TXT was no good. It is more compatible of course. So it
has some advantages.

>Totally *disagree*. If that's 'one of the best things' on the Atari
>platform, then it's very dire indeed. Hypertext help is a nicety, it's by no
>means *important*!! Decent functioning software is *what's important*, not
>flashy *help files*. :((
hmm Nothing to do with flashy. Once again, Size, speed. You missed
that one apparently :/ Remember we're not on 450Mhz alpha wstations
here.

>>Anyway. Much more convienient than TXT files in any ways.
>
>Nope. Not at all. I can take my .TXT file in to work and print it on the
>laser. Then I can read it whenever I like.

Compatibility is your convenience. My convenience is that is is fast,
small, efficient, and well organized.

Looking for info on the Atari 1040 stf

I'd like to know what the big difference is between this model
and the 1040st/1040ste is.

Also, what type of serial port does it have? Will I need a special
cable to run any external modem?

Some of this is covered in the Quick FAQ, but the modem part is not, I
don't think.

I haven't actually gotten the unit yet, this is why I ask. I want to
be prepared. This'll be my first Atari computer, unless you
want to count the 2600vcs or the Jaguar. :)

| . . .

Surely the internal is also a 3.5 inch floppy? I wasn't aware that
any other size was fitted (as standard) in the ST.

Perhaps the problem is in the special shape of cutout in the case?
This _is_ different. As far as I know, and again there will be those
who know better, these are unobtainable. You might have to cut a
larger slot in the case of the ST.

>to Okami's PASSWD file, or not, at the choice of the user.

POPwatch already has that feature. You need to create a file called
ALIAS and place it two levels beneath your MAIL folder, or in your
root directory if you can't go two levels down. Your ALIAS file
should simply be the incoming TO: name (before the @ character)
followed by the name you want to give it. For example:

```
braves outrider
cab outrider
chopchat outrider
"\"chopchat outrider
cyberchop outrider
chiefs outrider
"chiefs outrider
"'chiefs outrider
comments outrider
```

3110. Re: Newsie .90 Bug?

Newsgroup: comp.sys.atari.st
Date: 1998-07-18 00:00:00 UTC
From: outrider@lvdi.net
Message-ID: <35b08a56fccfb46@lvdi.net>
Source record: 96703

I was trying out NEWSie .90 last night and found that it wouldn't find FKEYS.TXT unless it was put in my root directory. Also, whenever I went to save PREFS.INF, it gave me the root directory in the file selector instead of my NEWSie directory, as it has done in the past.

All my paths are set up correctly, and NEWSie is finding the PREFS file, along with everything else it needs (except for FKEYS.TXT, which it can't find in its own directory).

Anyone else find these same quirks?

This is getting confusing.

It is virtually a straight forward job to replace an internal ST disk drive. If you plug the Schagart interface (the biggest plug) the wrong way around, the drive doesn't get registered and the motor spins continualy.

There are some differences in the thickness of some internal drives, the older ones can be thicker. This means that even after cutting the case, the drive won't line up:(

The way I use to get around this problem is; firstly get down to you diy/hardware/where you can get raw plugs shop, and buy some of those you cut donw to size yourself. Make sure the hole is big ebough to allow the drive screws to go through.

Remove the old plastic supports, by using a pair of pliers and gently working it loose. After you've removed all 3, cut the raw plug down to the size

required. This will take a little guess work, don't worry if it's to big it will spray and give extra support when the drive is fitted.

The brass support you may find out you don't need, if you want to use it, I have found blue tack will raise abnd support it.

I hope this is of help, as I thought I'd cover the whole lot; I hope I haven't missed anything.

Cheers! for now
Steve

The E stands for enhanced, it has these enhancements:
4096 colours, hardware scrolling, blitter chip, dma & chip sound, easier to upgrade using SIMM's (some older one's have SIPP's) and 2 enhanced joystick ports; you can use the Jaguar's joypad with some software:)
>

Hi Louis, you may be on to something here. I usually run 2 different res's
, sometimes 800 x 600 and sometimes 640 x 480 (both 256 colors). Anyways,
I don't have any of my Newsie windows set to full-screen. I usually have
them just short of that, so I can see the borders (all those pretty icons
and colors <grin>). Anyways, try setting all your windows to just under
full-screen size, save, and then see if that works! ;-)

You need to check and see what emulation modes are supported on that
printer and see if it is one that has common Atari drivers, like Epson
LQ, HP Laserjet II, etc.

Gerry,

Have you tried contacting Steinberg Directly to see what is available
for ataris? There was a lite version of Cubase which was fairly
inexpensive and had the arrange windows. There were also some
shareware sequencers out that were'nt too bad either. Keep looking!

On 18 Jul 1998 14:20:02, gfm wrote:

>
>braves outrider
>cab outrider
>...

Ah, the wonders of English; I guess I wasn't clear. ;-)

You're describing just the opposite of what I suggest and forcing all KNOWN user addresses into a single file. I want separate files for KNOWN separate user addresses. It's a great feature, with multiple users, like we have here. Should I decide to consolidate into a singler user in the future, the alias feature will be appreciated.

I want all UNKNOWN users, for which I don't have an alias because I don't know what to expect, forced into a single, unique address. Therefore, the alias list would suffice for the list of known users provided I could specify:

97up-lis 97up-lis
edtech edtech
...
<rest_unspecified_stuff> a_unique_username

Thanks for listening,

Pat

Are you asking how to create new ROM chips Jason?

That would require an EPROM burner an appropriate software.
That's about all I know on the subject.

On a related topic. I have TOS 2.06 Roms that I bought from
Emulators Inc. to use with Gemulator. Since I find Pacifist and Tosbox
more useful I was wondering if I could replace the TOS 1.02 chips in
my ST with the 2.06 ROMS? Is it possible and would the benefits out weigh
the loss in compatability? The machine in question is a 520 that has been
upgraded to 2 Megs Ram with a Supra HD.

[][][][][] SYSTEMS [][][][][]

*** MEGA STE ***

Item : Mega Ste TOS 3.06, 4mb RAM, 1.44mb internal floppy

Trust me, this Mega Ste is faster then stock

Comes w/ :

*SC1435 Stereo Monitor *1 gig internal hard drive

*Migraph Hand Scanner *Floppy drive disk cleaner

*Joystick *STAR NX2410 printer w/box and Man.

*Golden Image DS/DD Ext. Floppy *Golden Image mouse w/mouse pad

*Manual *Chaos Strikes Back w/manual

*Language Disk

*450-500 disks w/ nice locking disk cases (ea. holds 90 disks)

*All Cables and power cords needed, including a power strip.

* If you want, I'll throw in 1.5 boxes of paper for the printer,
but I'm sure it's not worth shipping, due to the weight.

Asking: $400 + shipping (willing to entertain offers)

And if you want anything in the 'Misc" section, I'll pry throw
it in for FREE!!

*** 1040STf ***

Item : 1040STf TOS 1.00, 1mb RAM, 720K internal Floppy

Comes w/ :

* SC1224 Color Monitor w/manual * Owners Manual

* Floppy drive disk cleaner * Language & System Disk

* Chaos Strikes Back * 2 Joystick Extenders

* Mouse w/pad

* External hard Drive setup. 90mb worth of space, on the Link host
adapter. Autoboot with ICD. Comes in a beautiful case, with original
ICD software.

* External CD-ROM w/manual. Model: NEC-25. Comes with Extendos
(manual and original software included)

Asking: $180 + shipping (Willing to entertain offers)

And if you want anything in the 'Misc" sections, I'll pry throw
it in for FREE!!

That was already in MagiC 5.

I was hoping they upgrade it at least a little (e.g. multiple file selection, preset sorting, etc.).

3130. FT: Classic computer adventure games for Atari 2600 games

Newsgroup: comp.sys.atari.st
Date: 1998-07-18 00:00:00 UTC
From: bilstein@mail.utexas.edu
Message-ID: <6opfp6$ro7$2@geraldo.cc.utexas.edu>
Source record: 96824
Cross-posted to: rec.games.video.classic,rec.games.video.marketplace,comp.sys.apple2.marketplace,comp.sys.ibm.pc.games.marketplace,comp.sys.atari.st,comp.sys.mac.games.marketplace

I have the following classic Adventure/RPG computer games for TRADE for Atari 2600 items from my want list. Please do not email me saying "how much is X", I am not posting these for sale. My full trade list and want list can be found at my web site:

http://www.geocities.com/TimesSquare/Arena/3336/2600nexus.html

Here is what I have:

*Auto Duel w/box, map, manual, reference card (Apple II)
*Fahrenheit 451 w/box, manual, insert, reference card (Apple II)
*Fahrenheit 451 w/box (album style), 2 disks, Notes from the Underground (IBM)
*Infocom 4-in-1 sampler disk only (CoCo II)
*Infocom Deadline box, folder, tablets, interview, ref card, photo, memo, lab report, coroner's exam, letter to chief, casebook (Large folder style, no disk) (MAC)
*Infocom Mind Forever Voyaging w/box, Dakota, map, pen, decoder (Apple II)
*Infocom Moonmist w/box, "Ghosts", 2 letters, visitors guide (disk is copy) (Atari ST)
*Infocom Moonmist w/box, box, Ghosts of Cornwall, ref card, visitors guide (IBM)
*Infocom Quarterstaff complete (Macintosh)
*Infocom Seastalker w/box, map, decoder, 8 cards, badge, log book, start guide (Large folder style)(TRS-80)
*Infocom Seastalker w/box, logbook, 4 cards, decoder, chart, badge (IBM)
*Infocom Wishbringer w/box, envelope, map, "Legend" (IBM)
*Infocom Witness w/box, note, telegram, matchbook, "Santa Ana", "Nat'l Detective" (MAC)
*Might and Magic w/box, book, adventurers guide, and map (IBM)
*Moebius w/box, map, book, reference card
*Ogre w/box, manual, strategy guide, reference card (Apple II)
*Rainbird's Guild of Thieves w/box, disk, bank card, service contract, warranty, insert (Amiga)
*Rainbird's The Pawn w/box, disk, Tale of Kerovnia, gameplay book, Atari ST guide, poster, insert (Atari ST)
*Snipes w/vinyl binder, warranty, & dox (1982) (IBM)
*SSI Questron II w/box, disk, manual, command card, map (C64)
*SSI Phantasie w/box, 2 disks, rulebook (Atari ST)
*Time Zone (On-Line Systems) w/box, 6 disks, manual (Apple II)
*Ultima II w/large box, book, business reply, and memo from SOL (Apple II)
*Ultima II disk 2 only (Apple II)
*Ultima III (shrinkwrapped) (Apple II)
*Ultima III w/box, cloth map, 4 books, note from Lord British, reply cards

(IBM PC/PC Jr.)
*Ultima III w/box and 4 books (MAC)
*Ultima IV w/box, cloth map, 2 books, reference card (Apple II)
*Ultima IV disk 2 only, sides C & D (C64)
*Ultima V w/box, cloth map, amulet, book, diary, ref card, quick ref card, quest for clues (Apple II)
*Ultima: Savage Empire w/box, reference guide, start guide, map, magazine, catalog (IBM)

You're welcome.

>For people out there who use NEWSwatch with Okami, then get hold of the
>latest beta135.zip from Jos's web site, and see what I mean :-)

Erm, Gary, if you please: those programs are for testing purposes
only. They still are buggy. Moreover, the beta archive only contains
the latest versions of o.prg and oimport.ttp, and they are NOT
compatible with version U1.34 of oexport.ttp and oexpire.ttp. They do
not work well together.

I would encourage everybody to download the beta test package and test
it, and give me feedback, but not to actually use those programs.

That's exactly what I built in. It's the new `save-binary' command.

>an excellent complementary package for email control.

I did once make a start on putting NEWSie support into NEWSwatch, but NEWSie doesn't really suit having external programs supply it with data.

I've had to put so many workarounds etc. into POPwatch to cope with NEWSie quirks that I decided it really wasn't worth the hassle to do in NEWSwatch.

And anyway, NEWSie *is* a STiK/STinG news client with it's own online code, so it seemed a bit pointless in making NEWSwatch compatible.
The main point of NEWSwatch was so that I could use non-STiK offline news clients such as Oasis2 and Okami with STiK comms.

POPwatch was the same to a degree, although the NEWSie support is there because it provides *many* features for dealing with email that NEWSie doesn't. So it is of use.

>is this done automatically?

On my version of Scan X (not the latest BTW) you don't need to put the file extension/format in. Scan X saves everything other than line art as a TGA (Targa) file. Line art is saved as an IMG file.

Can't help you with the other problem though. Scan X and my MicroTek E3 work fine here with my Falcon, although I have to remember to switch Nemesis out before using the Scan X software. However, I understand the latest version fixes this little problem.

Hi again,

found out the following, after trying deleting the prefs.inf and saving
again etc.

First of, when setting a window to fullscreen by means of the window gadget,
the position won't be set in the prefs file as fullscreen, but will remain
as it was.
Repositioning the window by means of the top bar/resize button and then
saving prefs will change the setting in the prefs.inf BUT:
I set the overview and article windows to "about" fullsize (thats 640x480
here), my prefs.inf shows (0,15,639,459) for those windows, but they show up
full width but only about half height... So something strange is going on..

Anyone with a clue? John perhaps?

Sorry. :(Wasn't I meant to mention it to people then? You didn't say, and
because it's on your website everyone can see it anyway, which is why I
didn't think it was a secret.

How can people test the programs if they don't use them? Catch22 I think ;)
TBH, I'm confused. If I can't use it for real, how can I test it?

Perhaps you should do what I tend to do, and only release betas to a small
group of known people (which is probably what you did in the past).
Putting on the same web page as the 'real' version if you don't want all and
sundry to use 'em is a mistake. What I've also done in the past is create a
'secret' web page eg. www.the-gap.demon.co.uk/secret.html which contains the
beta but only certain people know about it.

BTW, I *am using* this beta, and haven't noticed any problems, apart from
the About dialog which I've told you about.

Also the time in this article should be 11:23. But I guess that's what
your saying about OEXPORT not being compatible?

Gary

I don't think I could sell it - we're too close. The ad. was placed out of frustration. Anyway...

What I would like is an Afterburner 040 or something similar, I'm quite poor but would exchange one of the following PC bits:

Orchid Fahrenheit Pro 64 PCI graphics card,
Turtle Beach Monterey sound card with Tahiti daughter board.

If the card was right, I also have a Silicon Graphics 4D/25 (16Mb RAM, R3000 processor @ 20Mhz) but I'd want a cash supplement with it.

Carl.

3141. no sequencers for Atari STE?

Newsgroup: comp.sys.atari.st
Date: 1998-07-18 00:00:00 UTC
From: gerrymcc@indigo.ie
Message-ID: <6oqau6$1q2$2@news.indigo.ie>
Source record: 96835

well, not really no sequencers, but I phoned up Sound Technology, the UK distributor for eMagic, and they told me that Logic (the MIDI only version) is no longer available for the STE. Cubase is only available as Cubase Score, for around ?450. What a drag, the Atari STE is still working great for me, so I guess I'll stick with C-Lab Notator for a while longer - I'd sure love to use an arrange-type page though, because it makes working with MIDI data much faster. I guess I should have upgraded when I had the chance...

The ST NEWS site, STNICCC 2000 and W3M3 magazine site are down until
August 1st. No worry, things will go great starting in August :-)

Richard

3144. POPwatch and Okami (great!)

Newsgroup: comp.sys.atari.st
Date: 1998-07-18 00:00:00 UTC
From: pmorales@primenet.com
Message-ID: <35b06f4a329ecc0@primenet.com>
Source record: 96838

I think this is a great combination which I have just begun to use. The latest NEWSwatch version got me over the hump; I was really resisting the previously required directory structure.

I like the PASSWD file's ability to specify active "users" addresses. This means that lists for Anna and myself are treated separately. *Real Nice*. POPwatch handles this nicely because the list mails are normally addressed to the list name. Because these names can be placed into the PASSWD file, all works well.

But, what I don't like (this has been mentioned here recently) is that mail to unexpected "users" are broken out separately by POPwatch and will not be imported by Okami because they will not be in the PASSWD file. The suggestion made here, recently, to scan incoming mail (easily previewed before download by POPwatch) and append them into an active "users" file works fine as a work-a-round but is not very elegant.

What I would like to suggest is that POPwatch have the option of a PASSWD list, similar to Okami, which would identify active users. Email to active users would be broken out as is currently done. Email to a non-listed, inactive, user would be placed into a single user file regardless of address. This single user file name could be added to Okami's PASSWD file, or not, at the choice of the user.

This way, the entire process can be easily controlled by the user.

Thanks for any consideration,

Pat

It could be that programmers are using form_center(), which centers the
dialog on screen, instead of reading the mouse position and displaying
the dialog nearer to it. I know that the programs I've written do that,
but since I'm using ST High res, the mouse can't be far from the dialog.

Okay, who's doing it? (TUS again?) and are they working on an STE version?
Another 10Mb will come in handy, especially since I've only got 2.8Mb out
of 4Mb free when using Magic and several other 'important' utils.

Not here they don't! I'm using the 1.301b overlay with CAB v1.5, the
v2.0 and, now, the v2.7 (demo). I haven't noticed any problems with it,
especially 'hangs'. I have noticed that if a server is down, and I'm not
using a proxy cache, it will wait for ~30 seconds trying to connect to
the server before giving up and returning an error #1. Other than that,
I've not had any problems.

Hi all,

I want to upload a file to the umich archives, but I no longer
seem to get a response when trying to ftp into
atari.archive.umich.edu (or msdos.archive.umich.edu). Where can
I find the new upload procedures?

Thanks,

Michael White (michael@fastlane.net)

>just that.

Great, thank-you!

>What I'm planning on implementing is this...

Sounds perfect to me. The only other thing I'd *sheepishly* ask for
is also allow the ALIAS file to reside in the POPwatch load
directory. Okami uses a file with the default name (in O.INF) of
ALIAS too and things could get confusing depending on how the folder
structure gets defined on one's system.

>The drawback (for me anyway) is that all 'real' users *must* be defined in
>the ALIAS file, otherwise they will simply default to the default user.
>I say it's a drawback for me, because being a Demon Internet user, POPwatch
>makes use of the SMTP envelope which contains *my* real address.

Ah, all comes to light. Here that is obviously is not the case. The
lists I belong to seem to make up a new, slightly different
derivation of the to address line every few days. :(

BTW, we're now hooked on this combination and decided, yesterday,
we'll be making a registration donation to our local hospital.

Thanks a bunch!

Pat

3152. LYNX Browser?

Newsgroup: comp.sys.atari.st
Date: 1998-07-19 00:00:00 UTC
From: SRipkowski@my-dejanews.com
Message-ID: <6otcnpjpq1@nnrp1.dejanews.com>
Source record: 96647

Is there a version of the text only Lynx Browser available for the Atari? IF so where can I get it?

I finally got my 1040 up and running OK, but with only 1 MB I dont have enough memory to render the html pages.

Wade
Daddy, what does formatting drive c mean?

No, I don't think so. There's nothing to stop you not defining a default
user, thus it would just act as it does now.

I have a selection of Atari ST titles for sale.

This List Updated 19/7/1998.

email: steve@steverosie.demon.co.uk

I'm looking out for the following, possible swap, part exchange etc...
Atari CD ROMS, 16-bit sampler cartridge/hardware etc...

All are on original media.

Key:
ds = double sided disks
ss = single sided disks
?d = number of disks
meg = one meg of memory or more needed
ni = no instructions
nb = no box
NSTE = Not STE compatable

Please Note The Key Codes Are Only There For Guidance, I cannot be
responsable for in accuracies.

That's exactly the problem I've had as well, although instead of saving it
as (0,19,639,383), which worked with v0.88, it saves as (0,19,639,159).
Minor problem, but I can live with it.

3156. New MyMAIL version

Newsgroup: comp.sys.atari.st
Date: 1998-07-19 00:00:00 UTC
From: erikhall@tripnet.se
Message-ID: <6otepk$oj7$1@minox.tripnet.se>
Source record: 96651

Hi all Atari users !

Now its time again for a new MyMAIL version
This time it got rev nr 0.65

It is mostly bugfixes and a new window handler i have worked with
in this version.

You can download from this address:
http://www2.tripnet.se/~erikhall/programs/mymail.html

Bugfixes and new things

**** 19.07.1998 ****
Rev: V0.65

- Many small bugfixes.
- Mail recieve details was not working properly
this is now fixed.
- A complete new window handler is inplemented in the code
to eliminate future problems and to handle animations better.
It gives smaller and faster code and is easyer to maintain for me.
- Faster code for opening of a mail.

The docs are only partly updated.

You can add or remove yourself from MyMAIL mailinglist.
The add/remove page is found at:
http://www2.tripnet.se/~erikhall/mymailupdates.html
The mailinglist are handled by MyMAIL automaticly.

Best Regards

Erik Hall

Source record: 96652

Hi!

> I'd like to know what the big difference is between this model
> and the 1040st/1040ste is.

The STE has the following improvements:

4096 colors instead of 512 (but you can still only use 16 at a time without
rasters)
Blitterchip
Hardware assisted finescrolling
Sampled DMA stereosound with bass & treble control
2 Analog joystick/lightgun/paddle ports
TOS 1.6x-2.x

I think that's all.. But I might have forgotten something.

> Also, what type of serial port does it have? Will I need a special
> cable to run any external modem?

No, a normal modem cable works fine. But the serialport won't work above
19200 unless you modify it.

> I haven't actually gotten the unit yet, this is why I ask. I want to
> be prepared. This'll be my first Atari computer, unless you
> want to count the 2600vcs or the Jaguar. :)

Well, they might not be the fastest but they sure are the coolest :)

/Peter

Excellent! Thanks, Gary -- you da man!

>The drawback (for me anyway) is that all 'real' users *must* be defined in
>the ALIAS file, otherwise they will simply default to the default user.

Of course, if I understand you correctly, you can still use it the
old way by not putting in the default username in the first position,
so I see no drawback.

Hi all,

Well, I still haven't got the new 520ST running yet... I did manage to pick up the power supplies for the disk drives, but still no p/s for the machine itself... I am not willing to pay more for a p/s than I paid for the entire set-up. If anyone has an extra they would be willing to part with, please let me know.

Thanx!

Slight misunderstandig. Of course, everyone can download the beta test
package and test it, but I thought you suggested people download it
and actually install it and use it in place of the current version.
That could be a big mistake. I just wanted to issue a strong warning.

>BTW, I *am using* this beta, and haven't noticed any problems, apart from
>the About dialog which I've told you about.

That should be fixed by now. Check the beta package regularly for the
latest update. I will also include bug reports and fixes in
bchanges.txt, so you can read what was wrong.

>Also the time in this article should be 11:23. But I guess that's what
>your saying about OEXPORT not being compatible?

Yes. The new version is now include in the beta test package.

>I have Standard MIDI eqpt and wondered if there were any converters
>that took GMMIDI files and translated them and vice-versa??

That's impossible. GM is just MIDI with standardized patch numbers, so that a sax is always a sax, and a orchestra hit is always an orchestra hit. The way to do it, is to remap your MIDI instruments to match the GM patchset.

Cheers,
Nick

.ST files are not ROM files, but disk images.

A ROM file is an image of the ROM chips from the computer. An .ST disk image
is generally a pirate copy of a game that is converted into a file. There
are programs to reconvert them back to disk. Look around the emulator sites.

From: jlog@zetnet.co.uk
Message-ID: <6otmis$8gf$1@irk.zetnet.co.uk>
Source record: 96666

Hi

I downloaded the demo version of DA's Layout but I cannot get it to work. Specifically when I try and create a text column, I am shown a font loader but I cannot load any fonts. Postscript fonts on the Bitmap CD are not recognised as proper Postscript fonts and Calamus fonts cause the program to crash when it tries to convert them.

I am using a DirecT60 (Hades board). Any suggestions would be welcome.

>I'd like to know what the big difference is between this model
>and the 1040st/1040ste is.

ST: No internal disk drive. No blitter chip. Mono sound. 512 colour palette.
No memory eexpansion facility.

STE: internal 720K drive, blitter, DMA stereo sound, 4096 colour palette,
extra analog joystick ports, RCA stereo jacks, SIMM memory sockets...

>
>Also, what type of serial port does it have? Will I need a special
>cable to run any external modem?
>

Er... a serial port. 19200 is the max speed on both, but it can be boosted
to 33.6Kbps with a simple modification, and to even more with a more
complicated mod.

>Some of this is covered in the Quick FAQ, but the modem part is not, I

it?

Because you don't need any. Any HD driver software will support it, even the
good old AHDI. Uwe Seimet's HDDriver is recommended though.

Don't forget that it's SCSI only. The parallel version will not work unless
you get an adapter from germany.

Can anyone tell me what these files are and why they keep appearing in various places, though there is no mention of them in any program docs that I have, please?

CHRIS.RSC: appears in ICNEDIT folder and elsewhere, but has tonight disappeared completely!!

GEMFILE.GEM: appears in Stello, CAB, NEWsie, Hardware, Texel and in N:\ .

Mystified,
Charles.

The window re-sizing was put in a looooooong time ago to prevent some
older machines from having bombs from clipping problems.

Recently I have seen where the co-ords are being compared to the
Desktop "work" height instead of the desktop "current" height. The
problem is that the co-ord should always be external "current" height,
so the comparison is causing the window to be reduced in height
incorrectly.

I think I have corrected the half-height problem in the next (0.92)
version.

I have found a laser printer that WILL work on a Falcon!

I got a Brother HL-630 and I tested it with my Falcon, and it
works.

Why? because it uses the normal printer port and it has HP
laser elum. built into it!

I've got it on my TT now.

3183. How much for 1040STe?

Newsgroup: comp.sys.atari.st
Date: 1998-07-19 00:00:00 UTC
From: jafreck <jafreck@concentric.net>
Message-ID: <35B2AC6B.6BCB57DF@concentric.net>
Source record: 96678

I am considering purchasing either a basic ATARI 1040ST or possibly the more capable 1040STe. How much does the STe go for in good working order? Is it worth having the STe over the standard ST? I want an ATARI 16bit strictly for nostalgic/hobbyist purposes.

Thanks,
JAF

3186. Iomega ZIP for Use with the Atari STE

Newsgroup: comp.sys.atari.st
Date: 1998-07-19 00:00:00 UTC
From: Filly Frankenstein <mr.qwerty@bigfoot.com>
Message-ID: <900805310.16991.0.nnrp-11.d4e49651@news.demon.co.uk>
Source record: 96718

When I first read about the Iomega ZIp Drive many years ago - it was in the context of use with the Atari ST - as a way of providing a 100MB HD option. Now that I own a ZIP for use with a PC, I can't find the software which will enable interface with my old Atari - does it exist - and where can I get it?

Thanks

Fil

Yes it surely does it job but I find it quite annoying. My alias contains
today over the 100 entries and is still growing.
Especially with maillists the alias can grow very quickly.

<roughley@HORMEL.unix.dsoe.com> wrote:

>As environmental variables, what exactly do these do?:
>
>#_ENV HOME=C:\USER\

If a program uses this variable then it should store its configuration
files here. The idea is each different 'user' can set $HOME to a
different place then they don't interfere with each other. Generally
speaking, only unix (MiNT etc) based stuff will bother with it.

>#_ENV PATH=;C:\

If a program can't find something then it can look at this variable to
try and locate it. The above means "look in the current directory"
(typically the one the program is running from) then if that fails,
look in C:\ for it. It is typically used for locating executable files
and is thus of most use in command line systems or within a compiler
environment.

That's not true. You can have as many different addresses in ALIAS
as you want. In the quoted part above, it could just as easily be:

braves outrider
cab inwalker

And so on.

>I want all UNKNOWN users, for which I don't have an alias because I

><rest_unspecified_stuff> a_unique_username

I agree that it would be nice to have a default username for unknown
users. It doesn't provide that, but it does allow you to specify
different addresses for known usernames.

A // port zip can only be used with a special interface card, and
software that fits in the cartridge slot. A SCSI zip can be used on an
ST that is equiped with an ASCI to SCSI converter that supplies
termination power as the Zip does not. As far as software - later
verions of Hard Driver directly support the Zip.

Hi,

There are hundreds of programs for making music and listening
to music which you can download at
http://www.hitsquad.com/smm/atari/

There is mainly ST software but there's also some for the
Falcon.

The site has software for midi, MOD, audio, recording,
multi-track, MPEG, soft synths, drum machines, guitar tuners,
samplers, patch editors/librarians, mp3 players, sequencers,
algorhythmic composition, and heaps more.

Source record: 96734

Is HSMODEM needed for STing to work, the less I have in my AUTO folder the better. Why do I sometimes get tranfers of up to 7k per sec at 33.6, and other times only 600 per sec. CAB sometimes spends a lot of time waiting for data. Transfers through the newsgroups are pretty much more stable, at least accounting for jams within the server, but CAB will transfer the first 5 or 10k real fast and then take forever to get the rest. With 2 processors in the machine, I's expect it to perform at least as well as a 486, or at a slow p75. If only we still had all those programmers who pushed the ST past it's limits writing programs for the Falcon. Besides the Apex viewers, and Aniplay, I haven't seen many programs that fully utilize the Falcons capabilities. Maybe I'll try to learn how to program.

I saw DIY instructions that work for some 520 and 1040 systems. It
required a little soldering. IIRC, the file can be found on most Atari
ftp sites as tos206up.zip (or .txt).

Hopefully there's an easier/better solution.

If you go into the Hall of Fame dialog from the About dialog, then when you
try and exit it, the dialog doesn't disappear and the program locks up.
Under MagiC5.11 you have to kill it via the task manager, under TOS4.04 you
have to reboot the Falcon.

><rest_unspecified_stuff> a_unique_username
>
>Thanks for listening,

Ok. Ok. I give in. I've just started putting some code into POPwatch to do
just that.

What I'm planning on implementing is this. To define a default username you
simply make the first line of the ALIAS file thus:

* username

Then POPwatch will look through the ALIAS file and if no entry was found for
the given address, then this default will be used (in this case 'username').
How's that? Does that sound like it will do?

The drawback (for me anyway) is that all 'real' users *must* be defined in
the ALIAS file, otherwise they will simply default to the default user.
I say it's a drawback for me, because being a Demon Internet user, POPwatch
makes use of the SMTP envelope which contains *my* real address.
eg. If I get an email and the To: address is mailinglist.@blob.sd, without
the SMTP envelop (which is all non-Demon users) PW must use 'mailinglist' as
the address (hence the ALIAS file), with the SMTP envelope PW knows it's
actually for user 'gary'. Clever eh? And that's kind of why I've been so
slow in putting this default thing in. I never really appreciated it's use.

Anyway, enough waffle. Basically *if* you have a *default* defined in the
ALIAS file, then you *must* define *all* known users else they will be
defaulted to the default. Hope that makes sense ;)

Take a look at HDDRIVER. HDDRIVER supports media that are at the same
time DOS and TOS compatible. This way you can exchange data without any
problem.

The STe uses regular simms. Make sure that if you get a STe it has
TOS 1.62, and not 1.06. The STf is supposedly more compatable, but I
had an STe for years with TOS 1.62 and have had very few compatability
problems. That's even with a lot of games with "compatability
problems" with the STe.

You can pick up a STf for under $100.00, I've seen them as low as $50,
and have heard of swap meet purchases for $2. The STe is somewhat
more desireable, but you can find them for under $200, maybe even
$100.

Don't forget that your mail/news servers are usually on your ISP's local network, therefore, very "close" to your dialup gateway. Websites are usually remote servers on the other side of the world, the networks you go through to connect to them can be very different. Your ISP's connection to the outside world can be weak too. Your ISP's website will usually be quite fast. If not, then the problem might be CAB.

Cheers,
Nick

That's a problem with the CAB.OVL, try another version. There's a zillion versions of the OVL for STiK/STiNG, and all of them has some sort of problem depending on your system.

This will be because the modems are doing in-line compression, won't
it? You can't ACTUALLY transfer bytes at this rate down the phone
line.

>Binary files will normally download at an average
>of 2500 to 2800.

Yes. A compressed (ZIP, LZH) binary transfer is the best indication of
real line speed as it is unlikely the modem compression will have
anything to compress. In theory a 28k8 connection will transfer a max.
3200bps of 'real' bytes.

If in-line compression is taking place it is vital that your DTE speed
is fast enough to cope with the bursts of data as it is uncompressed
in your modem. Compression ratios are, typically, 3:1 so your DTE of
115k2 is fast enough not to cause a bottleneck.

No such luck! fits freely either way round. I have determined the pinouts however by assuming that as the Falcon only boots in one position this must be the correct one. Now, if I can just figure out which of the 4 remaining pins supply power without blowing anything up, i'll be happy :)

WARNING - never buy a drive without cables, never try to fit an internal component after 3 glasses of wine, don't belive the Titan IDE fitting kit will actually enable you to fit an IDE drive.

regards, Steve.

Hallo Micha,

ich finde es zwar nett, dass Du mir helfen wolltest. Leider verbreitest
Du eine Menge Halbwissen. Also speziell fuer Dich:
- ESPRIT: Dies ist das allererste Spiel der Oxyd-Reihe. Es hat dasselbe
Layout und die gleiche Funktion wie die Nachfolger. Vorteil von
Esprit: Jedes der 100 Levels ist in einer separaten Datei abgelegt.
Inzwischen gibt es sogar einen Leveleditor fuer Esprit. Ich habe die-
ses Spiel selbst schon gesehen und durchgespielt. Leider sind mir die
entsprechenden Disketten abhanden gekommen oder defekt!!!!
- OXYD : Neue 100 Levels, ein paar neue Funktionen! Alle 100 Levels
sind in einer einzigen Datei abgelegt.
- OXYD2: Neue 100 Levels, ein paar neue Funktionen! Alle 100 Levels sind
im PRG-File enthalten
- OXYD magnun: dito
- SPACOLA: Ein voellig anderes Spiel (Man ist ein Weltraumhaendler und
hat den Auftrag, bestimme Raumstationen zu beliefern - mit Hindernis-
sen versteht sich). Lediglich der Autor und die Vertriebsfirma stim-
men mit OXYD ueberein.

Ciao
Wolfgang

So presumably (yet again) no sign of those last few AES 4.1 elements (i.e. toolbars). I wish they'd add those last items, so that more programmers feel inclined to use them, and hence they'd become more popular. It seems that ASH are pretty good at offering version upgrades (i.e. version 3.x to 4.x) with the sort of minor features and bugfixes you'd normally expect of a point upgrade (3.1 to 3.2).

See my post on NVDI for more...

only one meg of RAM, keep it and be happy, NVDI 5.x will take much more RAM...
>

I wish the NVDI programmers would show a bit more initiative, now that they
have (I presume) the dominant VDI on serious machines. There are quite a few
new functions they could add to bring our machines more in line with modern
systems - or even to exceed them - without compromising compatibility with
older software.

In particular I would like to see scalable fill patterns (via a new VDI call)
for hatches. I don't know how many times my widely spaced diagonal lines in
Kandinsky have come out as closely spaced grey blurs on priniting.

How about linestyles for more than 1 pixel thick lines? Again, a new system
call (or one to switch the option on and off) as it could break some old
programs.

Definable radius for rounded boxes.

There are plenty more; just look at any good CAD package for inspiration
(more varied line endings, scalable line endings for various sized arrowheads,
more (and scalable) marker types, etc.)

Lets face it, NVDI has enough market share to virtually be considered as
a /de facto/ standard - so why not build on that user base to add more
functionality rather than either letting it stagnate, or just producing
minor tweaks and beautifications.

Hi Jo,

Sorry, but I got the impression, that you didn't understand my request properly, because I have already ordered the game 'esprit' at dongleware and digital art and Application Systems Heidelberg. But they didn't answer
my request.

By the way, there was a reason why I wrote down my message in German: "Esprit" works only with German TOS. Therefore I expected help only from Germans.

Bye
Wolfgang

There is a tiny "1" right next to pin 1 (on the PCB), you'll see it if
you look really hard :-)

>one. Now, if I can just figure out which of the 4 remaining pins supply power without
>blowing anything up, i'll be happy :)

That's pin 41-44, which you should *not* use to power 3.5" drives! Buy
a standard power-cable (extender) from a PC-dealer, cut off the
connector you don't need and solder the cable directly to the PSU.

Some people says that the Falcon PSU can't feed an additional 3.5"
drive, but I have had one 2.5", one 3.5" and one CD-ROM connected for
over a year without problems. Then I switched to a PC-PSU which
exploded (dry caps) after three minutes ;-)

I'm planning on adding a few new sections the Quick FAQ, but I'm no
expert in these subjects. I'd like links and information about the
following stuff:

- Printer drivers (GDOS or Not).
- LAN networking (especially using the Falcon/TT Lan port).
- Any other topic that might be missing from the Quick FAQ.

Cheers,
Nick

na, dann weiss ich das jetzt ja auch. auch wenns mich im leben nicht weiterbringt.

fuer die games gibts wohl keinen support mehr, und irgendwie scheint sich auch keiner so recht dafuer zu interessieren, in der richtung noch was zu tun. wahrscheinlich schade (wahrscheinlich deshalb, weil ich es selbst noch nie gespielt habe - nur mal ne demo gesehen.). ich kann mich nur noch dran erinnern, dass mich die musik echt beeindruckt hat -hat wohl ziemlich was (musikmaessig) aus dem ST-chip rausgeholt!
aber auch in der hinsicht stellt meine meinung keine referenz dar - sorry, ich kann halt auch nur das schreiben, was ich weiss.

ps: hast duï¿½s schon mal mit ner anzeige in der ST-Computer / ATARI Inside probiert? kleinanzeigen sind ja eh kostenlos, und schaden kanns bestimmt nicht - auch duerfte die anzahl der erreichten deutschsprachigen atarianer etwas groesser sein - kann mir nicht vorstellen, dass alle diese NG lesen...

so long, -micha-

The standard 1040ST and the 1040STf are the same machine. The "f" is typically not used, as all 1040's had internal floppies (which is what the "f" designates).

> Also, what type of serial port does it have? Will I need a special
> cable to run any external modem?

Any standard "XT" type modem cable (I.e., 25-female to 25-pin male) will work.

Not sure what kind of cable that is, since my SC1224 has a fixed cable
that can't come off.

I beleive that some of the SC monitors sold here had a Scart connector
that used an Atari/scart cable.

Anyway, dependin on where you are in the world, you could try calling
Best Electronics or Bravo Sierra or B&C, or you might look into building
one yourself, from a standard SCART cable, as long as you find an Atari
monitor connector. I know that in Europe, several electronics suppliers
have them.

Pinouts are in the Quick FAQ of course...

Cheers,
Nick

I had that trouble once, I found that one of the capstors had
slowly come lose, and it was only making ontact off & on, had it
replaced and it working ok afterwards. This might not be your
trouble but wouldn't hurt to look at those.

3244. Irresolvable problem ?

Newsgroup: comp.sys.atari.st
Date: 1998-07-20 00:00:00 UTC
From: apm.byl@thefree.HAIRnet
Message-ID: <35b37892.1277540@news.thefree.net>
Source record: 96627

I am having trouble getting STinG to work. I can connect to my ISP and send pings which return OK. But neither CAB nor newsie work as both hang at the resolving stage. I've also not been able to get any response using the resolver tool built into the dialer.

Can anyone suggest what needs to be done? RESOLVE.STX appears to load ok and as far as I can see I've listed the nameserver's ISP address correctly in my DIAL.SCR. My ISP uses the PAP/CHAP password system and PPP for communications.

Thanks

Alan Maydwell

You can actually use 115K port speed? My setup is similar (modem is 56 Flex)
but I can't use more than 57600 as port speed because mouse movements are
disturbing modem on higher speeds :(

Have you done anything special to avoid that problem ?

I assume you mean this:

Added shel_read() to get program path vs current directory (thanks Ronald!)
Due to Ronald's rant, I have implemented the shel_read() call to get the NEWSie
program path from the AES, rather than rely on the current directory to be the
program path. Of course NEWSie will continue to look for the PREFS.INF file from
the current directory, and will prompt for the PREFS.INF file if it cannot be found.

I still don't see why it would find all its files in the program path
except for FKEYS.TXT, which needs to be in the root.

It's finding PREFS.INF in the program path, though when when saving,
it puts the root path in the file selector (no biggy, but different
from how it used to behave).

Hi Jo,

from what I know, the special NVDI's are only for ET4000 based cards and for the Matrix 1208/1208E. There was a German guy the other day selling NVDI for a Matrix 110, but Wilfried Behne told me he had only NVDI for the 1208 series. The 1006 won't work with it! There were plans for a NVDI for ET4000 "super" or so, but Wilfried doesn't do that one, it's developed (IF there's any development) by others.

Early this year he'd no plans directly for a ET6000 version.

Now comes the problem: where to find a card?

Then the Riebl's: I know Best Electronics used to have a small stock some time ago, but I don't know how much now and at what prices. They sold them for around USD 50,- in Neuss, but afterwards the price went up to 2 or 3 times that much... looks like the Riebls are becoming popular again :-)
Next problem: how to put in a GFX card AND a Riebl together?

Success,

Assuming you have entered the nameserver's *IP* address (four numbers separated by dots) rather than its name (which it can't resolve cos it can't find itself) - see Q13 in the STinG FAQ (in STING.HYP), the only thing which springs to mind is the use of CHAP which STinG doesn't support AFAIK. PAP, yes, CHAP, no.

OTOH, I wouldn't have thought you could log on at all if the ISP *required* CHAP as it couldn't authenticate your password, so would terminate the connection. But I'm guessing at that as I'm no expert in how CHAP would affect the login process.

Assuming that CHAP isn't the problem, you could also try leaving the nameserver setting blank or set to 0.0.0.0, as PAP will sometimes (I think depending on how your ISP sets it up) let the TCP/IP stack know which nameserver to use as well as negotiating authentication and PPP stuff. STinG will pick up dynamically allocated nameservers this way, I believe (from a discussion in here a short while ago).

Hi everybody!

There is also the posssibility to put a PC-Mouse to the serial-port of any Atari.
Then only the program WRAPMOUSE is need. It provides both mouses: the atari-one
and the pc-mouse (also the py-mouse with three keys)

regards

Sven

1) Where did the "Control Panel" originate from? Did Atari come up with the name or was it borrowed from another OS?

2) If Atari came up with it, they should sue Micro$oft for the use of the term in their Windows products.

Just something to think about...

3258. FS: Classic Infocom game still in shrinkwrap

Newsgroup: comp.sys.atari.st
Date: 1998-07-20 00:00:00 UTC
From: Matt Senecal <msenecal@ucsd.edu>
Message-ID: <35B36B87.93CF2C1C@ucsd.edu>
Source record: 96641

I have a copy of the "Zork Trilogy" for the Atart ST, by Infocom, unopened and still sealed in the shrinkwrap. This is the special "three-in-one" release they did in the 80's where all three Zork adventures were put into one package. I'm not kidding when I say that the package is unopened and the whole thing is still sealed in shrinkwrap! If you are interested, or an Infocom collector, make an offer!

There is no notch on the Falcon motherboard ;-)

Look at pin 1 on the motherboard that must go on pin 1 on the drive.

HSMODEM or another serial port patch (Fast Serial) is needed to provide
stable commnication performance.

> the better. Why do I sometimes get tranfers of up to 7k per sec at
> 33.6, and other times only 600 per sec. CAB sometimes spends a lot of
> time waiting for data.

Actually I have gotten upto 10K per sec using 115K (text files) using my
TT and a 28.8 modem. Binary files will normally download at an average
of 2500 to 2800. The actual speed that you get is really determined by
the connection between servers. If traffic on the 'net' is high,
data transfer rates can slow to an absolute crawl.

FWIW the typical transfer rates I get with CAB/Newsie/STik/STing and a
28.8 modem with my TT is as fast or faster than what I get using a P166
Compaq/33.6 modem and Opera 3.21. This is logging on thru the same ISP.
It is quite possible that my home telephone line is a little "cleaner"
than the lines at work.

Steve

3262. Contact info wanted for Atari, particularly for specs on old Mega 2 power supply

Newsgroup: comp.sys.atari.st
Date: 1998-07-20 00:00:00 UTC

From: ag352@chebucto.ns.ca
Message-ID: <6oubne$p$2@News.Dal.Ca>
Source record: 96685

In it's a stock 1-meg ST, STf or whatever, don;t pay too much for it. Some sell for $100, most for less than that in 1998. 520's they give away.

The STe is more desirable. $100 to $125 is possible, or as high as $170 if populated with 4 1-meg SIMMS.

Most people who get rid of their Ataris currently are giving into Windoze, and thus parting with the full set of peripherals. For a figure like $150 to $200 you might end up with all sorts of stuff. possibly an old 300dpi laser printer and everything. Good luck!

Also: Falcons now sell for under $500, if you can find one, that is...

I did disable the graphics, but even at that it doesnt have enough memory to render a medium size site (ie: www.infoseek.com or www.dejanews.com). Can I adjust the STinG ALLOCMEM setting down from 100000 or will that adversely affect its operation?

Nick,

I hate to disagree with you - but with my TT (TOS 3.06) or using MagiC
if either HSModem or FastSerial are not loaded I would get all kinds of CRC
errors when using speeds highter than 9600 on binary downloads.

That's what I meant. HSModem is not required (STinG will still run, but unreliably), but makes the connections more reliable. Without HSModem on TOS 1.x, STinG will not even run.

Cheers,
Nick

They don't exist anywhere any more.

You can get the schematics of the powersupply on several Atari FTP sites.
Look for a file called netzeil.lzh or something.

```
New at Systems For Tomorrow July, 21st 1998
~~~~~~~~~~~~~~~~~~~~~~~~~~~

** Special ** till August 1st, 1998
Buy any regular priced item and add an origional MIDI Maze for
only 99 cents. Kill a Happy Face! Normaly $4.99.

World of Atari 98!
Make sure to visit us at the World of Atari show August 22nd and
23rd in Las Vegas. Check the World of Atari link on our web site
for more information.

Image Copy 4.1 for TOS Computers $49.99
The must have image conversion/viewing/printing program.
Supports a wide varity of image formats, and provides high
quality printing support for color inkjets. From FaST Club.
Image Copy 4.0 to 4.1 upgrades are also available for $9.99.

Xchange for TOS Computers $19.99
Vector graphic conversion program. Supports the following
conversions: Will convert EPS, AI, WMF or WPG to either CVG or
OL. It will also convert CVG to EPS or OL to AI. From FaST Club.

Fonty for TOS Computers $24.99
This is a fully featured editing program for creating and editing
Calamus CFN-format font files. Fonty features include: draw mode
icons (Hammer mode, Pliers mode, Move mode, Select path mode, left
and right kern mode), Grids and Guide Lines, Manual and Automatic
kerning, Backgrounds for tracing (a Degas picture or a complete
GEM font), a full feature Calculator to mathamatically manipulate
fonts, and Window scaling. A separate program, PFB2CFN, reads a
Postscript Type 1 Font file and copies it into a Calamus CFN font
file. From FaST Club.

Scribble Synth for TOS Computers $29.99
This program is a software-based sound synthesizer. Scribble
Synth is a true additive synthesizer, but with a difference, You
actually draw in frequency envelopes with the mouse! The results
are quite amazing. Strange Sci-fi Warbles, time-based pitch and
filtering effects, plus frequency modulated sounds are all
possible. From Electronic Cow.

EC-909 for STe/TT/Falcon Computers $39.99
EC-909 is an analogue drum machine emulator for the
STe/TT/Falcon. It features sixteen origional TR-909 sounds with
various controls. EC-909 can create single bar patterns in
```

real-time, and then export them into your direct-to-disk recorder or sample editor as AIFF or AVR format samples. From Electronic Cow.

Select CD For Falcon030 Computer $29.99
This CD contains the latest versions of some of the best Falcon specific Public Domain, Shareware and Freeware releases. Including games, demos, graphic programs, music programs, product demos and more. From floppyshop.

Sound and Stuff CD for TOS Computers $39.99
The Atari Musicians Toolkit. Includes hundreds of music fines in MOD, SNG and MIDI formats, Masses of superb quality samples in AVR format. including: Drum loops, percussion, synthesized sounds, acoustic instruments and effects. Lots of useful utilities for musicians. Music and audio programming information. A vast collection of MIDI and Sound related PD/Freeware/Demos/Shareware programs for the Atari. Complete version of Sound Chip Synth v2.32. From floppyshop.

Pix Art 4 $69.99
Latest version of the popular art package. Now supported by Homa Systems House.

MidiPlay $49.99
This is a player of MIDIFILE without additional hardware for the Falcon030!! It plays the MIDIFILE with digital sounds! Features: Play all the MIDIFILE following the GM norm * Up to 24 voices on an normal Falcon * Each channel have a dynamic polyphonic voice. * You can change the sound of current channel. * Function SOLO (play only the channel), MUTE (not play the channel). * Viewing of volume, information for each channel, bar, time, etc...

Digital Home Studio $129.99
This is a 32 tracks editor/player of audio/midi channel tracks for the Falcon030. With DHS you've got a editor of track, a sampler, a multi effect and an station of Direct To Disk! Features Include: Up to 64 audio channels (depending of your speed system) * For each track, you can programming anywhere in the music, the panning, volume effect, the volume, master volume, etc... * You can put or stop an effect anywhere in the music. * Up to 9 octave to replay audio sound or Midi sound. * Sound up to 50Khz 16 bits stereo * Up to 12 track in Direct To Disk (C.D. quality) * Up to 32 Midi Tracks * Mix audio tracks, D2D track and Midi Track in the same editor of track. * You can put a D2D file anywhere in the sequence * Digital Effects (Echo, reverb, flanger, equalizer, etc..) avaible on audio track or in the sample * Without quitting DHS, you can sample and work on sound (cut, copy, volume, autoloop, etc..). * Sampler avaible with Digital Effect (Reverb, etc..)

Expand $64.99
EXPAND emulates a Midi Expander on your Falcon030 computer. Loading audio sound, you can plays them even in D2D. Features: Play instrument like a Midi Expander * Use Audio instruments with multi-sample, envelop of volume, pan,... * Each channel have a dynamic polyphonic voice. * Use the 16 Midi channels * Understand the most of Midi messages like program Change, Note-on (with velocity), Note-off, Pitch,Main volume, Pan pot... * A very good interface.

Live Machine $64.99
Live Machine is a D2D program for accompanying someone during a concert. Live Machine can be controlled by MIDI messages! For the Falcon030.

Also Available:
MIDI Arpeddiator $27.99 MIDI sequencer
Sound Chip Synth $19.99 Software synthesizer
Snippit Synth $29.99 Granular synthesizer
CAB 2.5 $49.99 HTML browser /w PPP socket for MagiC
Atari Works $79.99 Easy to use home/office suite.
Lattice C 5.6 $139.99 C Compiler.
True Image $29.99 Image Processing Package.
Alien Thing (Expert) $19.99 Alien Blasting fun!
Tetris II $11.99 Cool Tetris game
Desktop Solitaire $19.99 8 solitaire card games for TT/Falcon
Face Value $69.99 Visual style GFA programming
All Things Falcon CD $9.99 Tons of Falcon PD/Shareware on CD
Hard Disk Sentry $39.99 Optimize that Hard Drive
Photo Show Falcon $9.99 View Photo CD discs on the Falcon
Card File 4 $29.99 Personal Information Manager
Moving Pixels CD $29.99 Software Collection /w sources on CD
ESG Clipart CD $19.99 IMG, CVG and GEM/s clipart on CD
True Paint $19.99 GEM based paint package
Plus about 400 additional products for your TOS Computer!

>33.6, and other times only 600 per sec. CAB sometimes spends a lot of
>time waiting for data.

7000 bps is very good, in my experience with a 33.6 connection. Since
you've got a good connection sometimes and not at others, it most
likely depends on 'net traffic and how many users are dialed in to
your ISP at the time. It could also depend on where the site you're
accessing is. Some sites work better than others. I've had one go as
slow as 300 bps.

>With 2 processors in the machine, I's expect it to
>perform at least as well as a 486, or at a slow p75.

Mostly, your download speed isn't as dependant on your computer as it
is your modem and ISP. The computer's bringing it in as fast as it's
being received. The only thing using both processors affects is how
fast it's displayed. On this point, I'd like to see more DSP support,
too. However, I can also understand the point of view of the
programmers. They would need to make multiple versions of every
program involved (CAB, STing, CAB.OVL, etc.) to get it to work at it's
best for each machine. This would be a programming nightmare, create
huge delays in the release of up-to-date software, and frustrate the
heck out of the programmers. The best you could do is to use CAB.OVL's
that are optimized for the 68030, use the latest versions of CAB and
STing, use the DSP JPEG decoder OVL, and accelerate your Falcon (if
you haven't already). Our machines aren't exactly top of the line
anymore, even with the DSP's. Until we have a 68060 or PPC card
available (don't hold your breath for that), we don't have that many
options any more without buying a newer machine.

>If only we still
>had all those programmers who pushed the ST past it's limits writing
>programs for the Falcon. Besides the Apex viewers, and Aniplay, I
>haven't seen many programs that fully utilize the Falcons
>capabilities. Maybe I'll try to learn how to program.

I agree with you. I'd love to see more of both software and hardware
made for the Falcon. The best we can do is let the programmers and
developers know that there are enough of us out here to support that

kind of thing, and support them as much as we want to be supported.

The "other" version of Okami (maintained by M. Schwingen) does that when restoring the database (OIMPORT -n). I have no idea if there is such option in Okami 1.31 (I have heard older versions of oimport make this correct only for the old database format).

I have suggested that OIMPORT lets flags that it finds untouched. Then the user is suposed to check if all is OK, it is easy to set the flags of the whole group to the initial state if one wants. If there are many groups a option to controll the behavoiur of OIMPORT would be useful.

>What's FastSerial. Does it replace HSmodem? Does it work on the
>Falcon? Does it need all those configurations that HSmodem needs. I
>don't like to have to configure stuff because I always get it wrong.

It does more or less the same as HSModem, but I don't know how compatible it is. STinG was written for use with HSModem, so I will stick to that for now.

HSModem doesn't require any configuration, as long as you have a standard setup. For an ST just put DRVIN.PRG and MFP.PRG in the Auto folder. FOr a Falcon, you just need DRVIN.PRG and SCC.PRG. THat's it.

Cheers,
Nick

3283. FS: Winnipeg Atari ST User Group fundraiser blowout! REDUCED EVEN MORE!

Newsgroup: comp.sys.atari.st
Date: 1998-07-21 00:00:00 UTC
From: trevor@cyberspc.mb.ca
Message-ID: <vaWs1.53$Gv4.608548@typhoon.mbnet.mb.ca>
Source record: 96500

GIANT ATARI ST HARDWARE / SOFTWARE / MAGAZINE / BOOK BLOWOUT!

The Winnipeg ST User's Group (STUG) is having a huge fundraiser to help keep our still-going-strong user group in good health, clear out some useful software that isn't getting much use, and help members do the same. The majority of the proceeds from all sales will go directly towards helping the club which has been promoting Atari since 1986 in Manitoba, Canada.

Please look through our list and pick out something you can provide a good home to. All hardware/software is fully guarenteed for 2 weeks from receipt. Everything comes with full email tech support from a knowledgable STUG member, we'll try our best to help you out!

If you want a whole bunch of stuff, discounts are available. Let us know what you think is a fair price. We just want good homes for all this STuff!

Every item purchased includes an issue of the STUG Chronicles (our newsletter) FREE!

All prices are in US$ funds as most sales tend to be to the US and so it makes everything easier that way. Canadian prices should be calculated accordingly.

Shipping is extra and NOT included in the price listed.

Thanks for helping out our user group!

Trevor Cordes - STUG President
trevor@cyberspc.mb.ca

This upsets me. The Amiga kernel is central to its efficiency and
general behaviour. Using another kernel will make it somwething else
than an AmigaOS.

>> be done under Linux. It will not include a Motorola CPU, it's probably
>going to use
>> intels comming Merced chip, or something else shitty. The "new" amiga

I'm not sure if I can be counted as such, I'm only a psrt-time
Atarian.

>1. If Atari came out with a new computer system would you buy it?

Not unless it's extremely cheap. I can't afford the Milan.

>2. If the system were not compatible with the ST would you still
>consider it?

The Fuji logo doesn't necessarily mean it's a good computer. Sure, the
8-bitters were really good, and the STs were cheap and cheerful, but
that doesn't mean that a new computer will be any good.

>3. Would you buy the new computer if offered a discount or rebate for
>your ST?

Hehe, perhaps, though I doubt it would generate a lot.

I know you don't want to hear this, but to use 115k2 on a Falcon030
you'll need to run MagiC... Under TOS (and MiNT, which uses TOS) the
keyboard/mouse-handler disturbs the serial-routines at 115k2 and
230k4.

I know, I have NVDI/ET4000 already. A Crazy Dots (2) would probably be
the best choice, but as you say: They're hard to find.

>Then the Riebl's: I know Best Electronics used to have a small stock some
>time ago, but I don't know how much now and at what prices. They sold them

I guess I'll have to fax them.

>Next problem: how to put in a GFX card AND a Riebl together?

It's possible to connect several cards to the VME-bus, but that also
means that the address-space for the devices can't overlap. I have
heard that some people has done this, but I don't know how. However, I
don't think I can find both a graphics-card and a Riebl-card, so I
don't think this is a problem in my case ;-)

How much faster? What Kb/sec do you get? over 11Kb/s? That would be _fast_
since already 11Kb/s is 88kbit/s which is quite fast, that's the troughput
speed at 115200 bps using nullmodem cable and Z-modem protocol.
660Kb/minute

coming to think of it ... I'm sure connecting the computers to a SCSI
drive would do the fastest transfers possible ... but then you can already
read the other drive .... but anyway.

> name or was it borrowed from another OS?

Apple's Macintosh was the first computer I know of to use this term. It
was an item in the Apple Menu for "controlling" system-wide behaviors,
very much like x-control. These days, Apple's Control Panel is a folder
with various programs in it that do the same job (which is where Microsoft
apparantly got the idea for its Control Panel).

I would guess that the recent settlement between Apple and Microsoft
covers any infringement in this area.

Message-ID: <35b47602.0@d2o29.telia.com>
Source record: 96514

I know you've got responses already, just wanted to make some stuff clear
(but I've also given my answers to you questions at the end of this mail)

You must think of that there are four different speeds that has to do with
how fast transfer speeds you can get;

1: port speed = hardware and driver's speed, for example 115,2kbps

2: modem speed = the physical connection between your and your ISP, for
example 33,6kbps (3,6Kb/s) from and 56,7kbps (4,2Kb/s) to you with
x2/flex/v.90

3: connection speed = the teorethical connection, actual data troughput that
is a result of the modem's compression and the type of data transferred,
remember that some of the bandwith might be used for error checking, for
example a connection at 78300kbps (9,8Kb/s) will never be able to transfer
data that fast

4: the source = if the data to you is sent by 2000bytes/s, no matter how
fast you're connection is, you can't receive the data at any higher speeds

The speeds should always be set to be capable of taking it's own teorethical
maximum peak load.

So theese are quite good setups and connection speeds:

modem computer connection
56k7 115k2 78k3
33k6 78k3 56k7

Get the picture? If not just ask and I could try to explain. But anyway, the
thing that makes internet slow is seldom it's slow transfers ... it's all
the waiting in between the data is received. Once a connection is
established for the transfer of a file like a picture that's part of a
web-page ... it's quite fast no matter you use 33k6 modems or ISDN.

Hope I helped and not the opposite.

It's not possible to implement Linux-plip on the ST/TT/Falcon, because
the printer-port lacks some lines. You'd have to implement
MiNTnet-plip on Linux to do this.

I'm not saying that you have the problem I had, but I just thought it could be useful to know;

My Mega 2 ST had from the beginning 2 ROM's but I changed to another TOS version and made the small modifications needed to use a 6 ROM chips newer TOS ... the sockets where there already. What then happened was that the machine crashed of vibrations, and sometimes randomly. The problem had to do with the ROM sockets but I changed back to the 2 ROM chip TOS instead of fixing it when a simple re-soldering of the sockets did not help.

I would say no, actually. A solid white screen will make your phosphors die
quicker - but every dot will die at the same rate. The result will be a gradual
fading of the screen, rather than the worse (IMO) option of having a picture
of your desktop permanently burned onto the screen.

Still niot as good as all black though.

Colin, I might be interested in this, but Bristol's a bit of a drive for me. Are you going to the ACC show in November, and if so, would you be prepared to hold it for me until then? I'll pay a deposit or (if you insist) the full price now.

Also, I'm predominantly after the H/W - I've got all the games already. Whilst I'll pay full whack to secure it, I'd rather pay less if you get any responses from anyone wanting just the games.

Cheers,

I get a Kodak Photo Disk when I send my film in. This gives me a disk of jpegs to use. Only kodak doesn't save the scanned image onto the disk in any order, that is, I get images that upside down, sideways, even backwards. Now I use imagecopy to view them on both my Falcon and TT, BUT when I send them to other people they have remarked about it as some of them can't turn the image.

I've tried setting the image right and then saving it, but it's still the same way. Is there any software that I can use on this TT or the Falcon to adjust the image and then save it the right way?

One of the first big MiNT distributions, the TAF-kit, came with X11 as default GUI. It works nicely on a 4meg ST. But lemme get this discussion straight, so far the line was that an Amiga can do anything an Alpha can do in Linux because an Amiga will run Linux as well, but that this doesn't go for Ataris because MiNT isn't fully Linux compatible? Are we forgetting that Linux will run on an Atari as well? (And, again, that X will also work under MiNT).

Maurits.

>
>HTH
>John

Setting NAMESERVER=0.0.0.0 doesn't help. I get the same behaviour
as my previous setting of NAMESERVER=195.34.192.12. Although the
dialer now complains that the nameserver script variable is in
the wrong format. I don't think this approach is likely to help as
I can get a usable connection using my PC with the nameserver
setting stated. Moreover the notes provided by my ISP indicate
that it should be stated.

Perhaps the problem does lie with the CHAP system. Although it
does seem odd that I am able to connect successfully. The only
reference to CHAP I can find in STING.HYP simply states what it
stands for.

Thanks for the suggestion.

It may not necessarily go for MiNT.

That does not address Atari in general.

A Falcon will quite happily run Linux and could
quite happily contribute to a D2 render farm
right beside an Ameboa, an Alpha, a Sidewinder
or any other supported platform...

>run on an Atari as well? (And, again, that X will also work under MiNT).

I think that if the programmers of CAB want to run a test on
each new verson of their program, they should try Yahoo.com!
Today one time I got as far as submitting my data for their
e-mail, then CAB bombed, and from that point on, CAB bombed on
the 1st page. I even deleted the yahoo cookie and cleared the
all folders of files too. still bombed.

Does anyone know yahoo's admit e-mail address?

Greetings Atarians!

I just want to tell you that my program hEARCoach, a program
for training your musical hearing, has been updated again.

I havenï¿½t added any new exercises yet, so this version contains only
some general improvements. New stuff includes:

* Bugfixing
* Better window handling (possible to move windows outside the screen,
and more...)
* A few keyboard shortcuts (Iï¿½ll soon add more of theese!)
* Window cycling added

Take a look at my homepage at:

http://hem1.passagen.se/gokmase/atari

Thanks!

3324. Possible Milan dealer in USA has some questions to potential Milan buyers...

Newsgroup: comp.sys.atari.st
Date: 1998-07-21 00:00:00 UTC
From: tj@oro.net
Message-ID: <tj-2107981455130001@i372.oro.net>
Source record: 96541

Hi, my name is TJ Ferreira from GodFather Computer, Inc. based in Pleasanton, California USA. GodFather Computer at present sells and services many computers and peripherals and have been seriously following the introduction of the new Milan Atari computer that is coming from Europe.

The goal of this note in the Atari newsgroup is to see if there are any potential serious buyers of the Milan that are looking for an authorized Milan dealer here in the USA.

We are planning a possible buy of the Milan systems in the near future and may start taking pre-orders in the very near future but before we go through all the motions of becoming an authorized dealer in the USA, we must first see if there are folks in Ataridom that are following the Milan and are interested in buying the systems as they come available.

Our company both sells and services computer equipment down to component level and we believe we can be an excellent avenue for USA and Canadian buyers for the upcoming Milan.

So please send me an email and let me know if you are an interested buyer of the Milan. We will keep you posted if we get good response from potential buyers and let you know how we can become your Milan source in the USA.

This is an important step in growing the Milan line here in the USA so let us know and we look forward to your responses.

TJ

From: dlormand@aztec.asu.edu
Message-ID: <6p0n3ufsb1@news.asu.edu>
Source record: 96642

Hi, all,
I was asking a while back about a slideshow program that would
a. use .PI1 or PC1 Degas low-rez picture files
b. use a sequence list file, or some other means than merely
the order in which the picture files were placed in the
folder
c. use the arrow keys, or some other method, whereby the
sequence of pictures could be followed forward or in
reverse, rather than only forward, as every other
slideshow program I've tried so far does.
d. maybe start from an arbitrary point in the sequence.

Someone recommended a VIDEOTITLER program by Dave Munsie. I have
not been able to locate this.

Anybody have a hint as to where I can find this program, or whether
it would fit the requirements, or whether there is a better choice?

hello,
Im having some troubles-
Ive been using a 14.4 , until today when my brother
gave me a USED Motorola Premier 33.6 as a gift.
The problem is, Its not working!
He tested on a a wintel machine and it works fine..
What happens it, when i try to dial, it doesnt actually
dial, the dial tone just comes up and it hangs there.
So what do I have to do? Im thinking some modem settings
for windows are confusing it? I tried ATZ but nothing..
Please help? I really want to use
this!
BTW, I have it connected to a Mste, with HSMODEM , and
in Modem 2
I have sting serial.cpx set to 38.4 ..
Please try to respond in email. I DO read this group everyday
but I miss ALOT of messages, and I think this is important:)
Thanks guys

This depends on the Atari you have. With a Falcon HDDRIVER is up to 50%
faster with SCSI drives and with IDE drives probably as well. With the
ST/STE HDDRIVER is considerably faster if you enable the "Fast ACSI"
option.
Simply have a look at the demo version:

3338. IDE hard disc drive difficulties

Newsgroup: comp.sys.atari.st
Date: 1998-07-22 00:00:00 UTC
From: mb@tos.pl.net
Message-ID: <QFYZCDC@tos.pl.net>
Source record: 96459

A member of our Atari user group recently purchased a IDE interface for his Atari STE copmuter from The Upgrade Shop, but we are having difficulties getting certain IDE drives to operate with the unit. Note that the problems are probably not in the unit but rather the drives - chances are the drives are faulty, especially since the same drives show the same faults on my Falcon machine which is otherwise known to be ok. However, as I am unfamiliar with IDE, I am finding it difficult to diagnose the problems. Perhaps someone can give me an overview of issues related to IDE.

While using HDDriver, version 6, on what appears to be a faulty disc, when trying to partition the drive with the HDDRUTIL program, it indicates that the disc is of zero size, and so it cannot be partitioned. Also, the HDDRUTIL program has another entry in the right-hand-most menu (unfortunately I forget the menu title) where the IDE discs can be configured. When a working IDE drive is connected, this dialog shows the number of heads, etc, but when a not-working drive is attached, that information is not filled in and shows in light-grey as if it is disabled.

What do these symptoms suggest? What steps can I take to diagnose a problem with IDE disc drives?

Any assistance would be appreciated.

There is no limit as long as you have an ICD compatible host adapter
connected to your ST/STE.

Did you receive my e-mail about upgrading the HP ScanJet driver, Nima? Somehow I think you did -- either you're too busy or you simply don't care to answer.

I've recently attained a copy of PhotoLine from someone who bought a PC... would you like the original owner's name and serial number? Or do you not care about a PhotoLine registration changing hands?

Have you tried to AT&F, this set the modem back to factory settings.

Have you tried any ATI? commands (information? commands), where the ?
can be anything from 1 to W.

One of the ATI`s return values might give you a clue.

cheers

Have you tried to format the drives? Some older IDE-drives gets
destroyed if you format them, important info (I don't know *what*...)
is deleted and the drive can no longer be used. It looks like this is
what has happened, and HD-Driver can't get the necessary information
from the drive.

```

I suppose it's a problem with a DTE speed.
On PC as default is 115.2 kbps, on Atari usually default speed is lower.

>So what do I have to do? Im thinking some modem settings
>for windows are confusing it? I tried ATZ but nothing..

The best way is to check this modem with a communication program (IMO
"Starcall" is the best) - have you done such a thing?

>BTW, I have it connected to a Mste, with HSMODEM , and
>in Modem 2
>I have sting serial.cpx set to 38.4 ..

Maybe your modem doesn't support this speed? Try to change it to 57600 bps.
My MEGA STE works with HSMODA07 and DTE speed 115.2 kbps.

Hi all,

I'm looking for a source of the old Antic ST library, particularly the Astrology program. My original disk, along with all the copies, has bitten the dust, and I want to install the program on my new Falcon (yes, the 4 meg machine was brand-new in the box as of yesterday.)

Also, am looking for the standard Internet setup programs, (PPP , Browser, Mailreader, etc.,) to put this pup on the 'Net.

I was a big Atari reseller in the early and mid-80's (sold over 1,000 ST's myself) so I'm happy to find the little beasties still being used and loved.

Any leads?

Thanks,
Craig Morehouse

Will, I got the machine used, paid all of $8.00 for it, and so
far it's been printing just fine. If it does go, I think I will
have gotten my $8.00 out of it.

This one had a ram upgrade in it, but it wouldn't work, until
after I removed the upgrade, now it's fine. I can pint up to a
5x5 print before the memory error shows up. So it's good for
small test prints and text.

>in a shoebox case now. Think I could just switch 'em?

660Mb is OK. Just check that it will allow parity to be disabled as
SOME shoebox host adapters (Supra for one) do not support parity. You
will probably be OK as most HDs will allow parity to be disabled.

Rather than just substitute you could make up a longer SCSI cable and
ADD the new one to the bus , making sure it had a unique ID.

Yep, it should do this. Make sure that your speaker is turned ON in
your desktop config. or by whatever ACC, CPX you use to set up the
machine.

This is an ASH Emailer problem. It seems the author didn't know
there was a rule about limited line length on Usenet. But some users
seem to know how to use it correctly.

Bye! Bruno.

I would also like to add that I have seen 1040STs with single-sided internal floppy drives, so I always thought that the 1040STf (like my old one) designated a double-sided drive, though I could be mistaken (and probably am)...

The 1040STe has stereo DMA sound which I believe is achieved by adding a second sound chip. What's great about this is that the STe (as far as I know) has two RCA audio ports on the back for channeling into your stereo amp. Again, I could be wrong but I'm just trying to help. Maybe someone can enlighten me on this... I know the STe my friend had many years ago was great with six-voice MODs... Did the STe also have the 12-bit colour palette (4096)?

Sorry, I had a 1040STf years ago and sold it and all of my software. Now I feel stupid for doing it and am trying to put another ST system together with little luck.

Louis

3379. Pardon my daftness...

Newsgroup: comp.sys.atari.st

Message-ID: <35B6A2BE.E6A00B59@sasquatch.com>
Source record: 96550

I've been out of the Atari ST scene for quite a bit of time now and am trying to get back into it. I just have a few questions:

1) What would I need (besides a stereo ST and a sampler) to start generating my own six-voice MODs?

2) Would anyone out there like to take some of this old Mac hardware off my hands in exchange for some ST hardware?

3) What is a Milan?

As I say, I have been away from STs WAY too long and just need a little help.

Thanks!
Louis

3380. Looking for TWAIN scanner driver

Hi all,

I have an old Mac PaperPort that connects to the serial port. I was wondering
is there a Twain scanner driver available for Atari's. I would like to
connect it to my LAN port on the Falcon. It would be nice if it could
interface through a desk accesory or via the clipboard into STraight Fax.
Thank you.

Peter Ross

I've had similar slow-down happen on occasion. If I'm downloading a large file in CAB (a picture or .AVI or something) it would start out with a fast transfer rate, then gradually slow to a crawl, and sometimes, even stop altogether (necessitating a reboot to un-freeze CAB).

I have used both HSMODEM 7 and FAST_SERial sucessfully with my Falcon/Supra 28.8/STinG/CAB. However, I _used to_ be able to run my serial port at 57,600 without any difficulties. But within the past few months, only 38,400 works reliably. 95 out of 100 tries, the modem won't even go "off hook" when the port speed is at 57,600. And anything faster than that has _never_ worked.

I'm guessing I might have a "flakier than usual" Modem 2 port. I'm hoping when I get the Nemesis board installed, this problem will go away!

3386. Re: Okami 1.34

Newsgroup: comp.sys.atari.st
Date: 1998-07-23 00:00:00 UTC
From: pmorales@primenet.com
Message-ID: <35b777523195f90@primenet.com>
Source record: 96399

I don't claim to be an expert but I'm wondering if adding a new default setting Okami for the from address makes sense.

Currently, Okami places the name from the PASSWD file in the From address of a message. This makes sense for valid PASSWD entries. But, with the ability to use the POPwatch ALIAS file to route messages into any user password we choose (a great feature!) we can now end up with nonsense From addresses.

If the fromaddr= is blank, leave it as it is and use the PASSWD entry.

If it's filled in, all outgoing messages get the specified From address.

Well, what do others, Jos in particular, think?

Okami, POPwatch and NEWSwatch. What a great combo!

Thanks,

Pat

>Hope I helped and not the opposite.

>Regards, K.Hampf
>e-mail: k_hampf@yahoo.com

The main problem I have is that CAB will transfer the first 5 or 10k real fast (6 or 7k per sec. Then it will get stuck and just sit there and slow down to 500 or so. For example if it is d-loading a jpeg form a web page, the first 10k will take 2 seconds, and then I can go get a cup of coffee(sometimes I can go to colombia and get fresh beans) before the other 50k of the file is sent. Could it be than my F030 just doesn't have enough power to sustain a fast transfer. I have transferred via FTP 1 meg files at over 3500.

Thanks for the info. It's good to learn new things.

Hi Mario,
Which drives don't work? Brand and model?
I've tested several IDE drives on my Falcon and never got them to work
perfectly - and some didn't work at all. While I'm waiting for your answer,
I'll try to find my old notes about those drives - if I can't find them, I
believe I'll be able to remember if they were the ones I've tried.

Best regards,

Here we go again.....

The darn things will fly through Calamus, DynaCADD, and what have you. We Atari people know that already.

The Milan ain't gonna sell to any but the scant 900 of us (or whatever the real number is, I just made it up) who still know how to pull productivity out of a GEM/TOS/NVDI system.

THE KEY IS COMPATIBILITY!!!! (sorry for the shout)

Compatibility both backwards and sideways: Obviously, a reasonably-priced PCI board with a Windoze/Pentium 233 should be bundled with it, to attract the great unwashed into it. I forsee that the economics are against this. There is no way a P233-on-a-PCI is going to be anywhere near as cheap as a stock motherboard.

Furthermore, there should be a true 68000 mode with cartridge-port feed-through for the MIDI enthusiasts. I for one refuse to give up my NOTATOR SL, and I know there are other music applications that are subject to the same hardware limitations.

Without those 2 things being offered and so advertised, the thing is just another niche DTP workstation (I know, there are other things too; this is my rant), just a faster TT with more RAM and a wider data bus. That isn't enough. Chris you-know-who discovered this in short order. How many of us actually bought that Canadian TT clone? Best of luck if you need service. Also the Phenix from France seems to have fizzled.

I would like nothing more than to have a net-flame to the effect that:

(a) No! thousands of us are lining up to buy this toy; our old software is good enough.

(b) The Milan is infinitely expandable as per Gray's cranky post, only better than that.

Still posting to UseNet with a 1040STe, I remain,

A 6 track mod tracker program. I'm not sure if there are any available for
the ST, as it has only 4 voices built-in. You will need at least an STE.
There are several trackers on the most popular FTP sites. Look in the music
directories of lip6 or umich.

>2) Would anyone out there like to take some of this old Mac hardware off

What about HDDRIVER/HDDRUTIL 7.5? Simply try the current demo version
of HDDRIVER 7.5 in order to check if you get a different result:

http://acp5.chemie.uni-kl.de/seimet/hddriver_english.html

> HDDRUTIL program has another entry in the right-hand-most menu

> disabled.

If an IDE drive is properly connected the information about heads etc.
is enabled. Usually you don't have to change this. See the manual or
README for more information about these settings.

This is true if you run plain TOS, i. e. without MagiC or Big-DOS. As TOS < 1.04 only allows 14 partitions with 256 MByte each you get 3.5 GByte active space. Newer TOS version support larger partitions and this means more active space. With Big-DOS up to 20 partitions are allowed, with MagiC up to 23 partitions. This way you get even more active space if necessary.

> Keep an eye out on this group as I'll announce the new beta here.

Dan, in the past when going to the ShowStats page from my home page,
I would always get the page that was in my disk cache, so I always
had to do a reload to get fresh stats. (Others have said they have
the same problem.)

V1.3003 seemed to fix that, and I started getting the fresh stats
right away without having to click on reload. However, it's now
broken again in v1.3004.

Any chance you can check that out? My URL is in my signature, and
you can get my stats by clicking on the little gray icon with the bar
graph that's in the navigation bar or the bottom left corner of any
of my main pages.

Thanks.

Unmodified Falcons can be a bit erratic at this speed - try reducing
the DTE one notch (57k6) to see if things are any better.

>>example 33,6kbps (3,6Kb/s) from and 56,7kbps (4,2Kb/s) to you with
>>x2/flex/v.90
>
>Is this the DCE, this is set at 33.6.

This is unlikely to be 'set'. The usual technique is to allow the
modems to negotiate the best spped they can manage which may depend on
local phone traffic at the moment. The 33k6 will represent the 'best'
DCE which you modem can attain.

There's obviously something wrong here. Have you got the usual serial
interface patches installed (HSMODEM, FASTSER)? You would expect this
sort of behaviour if your serial interface was misbehaving and kept
telling the ISP that it was reciving with errors.

Try the slower DTE first.

I've tried with plain TOS 1.04 (UK) to get partitions greater than 256 MBytes
working. I am using ADHI 6.061.

The partitions cannot be used; when you try to open the disk, nothing happens
ie. the icon darkens, but the disk will not open.

Is there some special partitioning scheme needed?

> Dan, might help to state shipping from where.??

Ordinarily I'd agree. But, since my earlier posts got absolutely no response I figured I'd see what happened. Apparently "free" sounds a hell of a lot better than "make me an offer" (to which "free" is an acceptable response).

"No response" isn't exactly true...

I had one guy ask me if I could promise this computer was "mint". The damned thing is ten years old! I have to ask how seriously you can expect someone to take you if you tell them a ten year old "tool" is in mint condition.

Such poor response led me to one conclusion. Give it away. (No cost to me. No profit to me.) That leaves me two options, give it away to a person who is interested enough in it to pay the shipping cost and who might be able to use it, or give it to my city dump.

So I figured I would try to give it away for the price of shipping first. If you're worried about how much that might cost don't respond. If you're curious, invest some time in communication and e-mail me privately.

Ultimately it boils down to one question. "How free do you want free to be?"

By the way, I've already got an agreement with a taker. It ships tomorrow.

Regards,

Dan

3418. SCART

Newsgroup: comp.sys.atari.st
Date: 1998-07-23 00:00:00 UTC
From: realname@signature.below
Message-ID: <1dcmnn9.wpoidfmkg6raN@ppp1.a1.tinet.fut.es>
Source record: 96582

I'd like to know how to build/where to buy a ST 13-pin DIN to SCART cable. I used to have one (I remember the h & v syncs were combined together via a couple of resistors). The cable auto-switched to SCART mode when the ST was powered on, so I believe it used the +12V output to do this.

Any help would be appreciated, thanks.

I too am interested in an upgrade path that is not an emulation of
the ST. Since there appear to be no US authorized dealers for any
of the upgrades (Milan, Hades, Phoenix, etc.) I will be looking at
whichever gets here first, probably. Wayne

I too am interested in the Milan, as this would be the perfect upgrade path for me and a lot of people in TAF, particularly at the price point for the new machine.

Besides, any new TOS machine that makes Sinclap nervous - to the point of his spreading disinformation about it already in .advocacy (he claimed that "90% of all TOS applications fall over on the Milan", which you have to take in stride as Sinclap admits that he's used an Atari a grand total of ONCE) - must be an impressive machine indeed.

Alas, I'm not going to Las Vegas so I won't be able to see the Milan first hand, but I trust that some kind souls who've tried it at the show will report on it here for eludication. :)

BTW, check out ST Informer 100 on their website, they've got a transcript of the IRC session with the Milan developers - fascinating stuff. They're even preparing a software bundle for it which will include a "lite" version of Papyrus and Smurf, and possibly an Internet suite along with it.

|is my rant), just a faster TT with more RAM and a wider data bus. That
|isn't enough. Chris you-know-who discovered this in short order. How many
|of us actually bought that Canadian TT clone?

Well I did for one. The reason that I bought the DirecT60 rather
than a complete Hades was that I could install it in a case of my
choosing (desktop rather than tower) and use a keyboard of my
choosing. In theory I could also have chosen graphics card, hard
drive etc but in practice I was guided by the seller (and got good
prices too).

Admittedly I have no interest in using it for music or MIDI (other
than listening to audio CDs) and I don't know how compatible it is
that way. But for my interest, document processing, it is superb
when used with Papyrus. It can't be used for games but my previous
setup of TT in TT high resolution was no different.

I agree that there is absolutely no point in bringing out a _new_
computer. It must be TOS compatible but I do wonder sometimes if it
would not be possible to re-write TOS to iron out all bugs and put
in the extras that our auto-folder programs give us.

Hello to everyone.

A long time since I have written to this group. But hey have to say
something once in a while.

Well this message is nothing more than a blatant plug for my web pages :)

http://www.finitive.demon.co.uk

There is a frames and non-frames page so you should be able to get around
either way. (And find out about the Baby Turtles, etc.)

But the real reason to plug the pages is cos I been working on the Atari
Section. Firstly it is a section on its own now. Still not much there.
Just a couple of things to download and 3 old referemces.
GEM DOS, BIOS & Hardware reference guides with little piccies and tables.
The information contained within is the original from Atari just set out to
look nicer on me pages ....

Anyone know of any mistakes in the texts or got any suggestions / critisims
let us know .....

Ade.

I Do not believe in Mumbling Frogs.

Sorry for the rant the other night. Energetic, forward-looking young newsletter editors suddenly turn into old curmudgeons after 10 issues.

Any of you people who DO buy the Milan, please type up an ASCII article relating your experience, for XEST magazine. We published David Acklam's T60 review last September. Unfortunately some of these hot new machines do crash :(

XEST submissions to: <ag352@chebucto.ns.ca>

Following for sale or trade: (Prices Negotiable)

NOTE: WILL TRADE ANY OF THE ITEMS ON THIS LIST FOR PC EQUIPMENT-Hardware and/or Software. Need a Hercules Stringray video card and soundblaster AWE 32 or 64-hint, hint.

Hardware-

ALL hardware is in good to excellent 'used' condition and pre-tested before shipping.

1040STf's-(still going strong!)1meg-used/tested.....$50ea.
Includes Atari Mouse or Marconi/Marcus 3 button track ball, your choice.

Atari SC1435's -14" stereo RGB monitor, headphone-jack, video cable, used/tested...$65ea.

Atari SC1224 12" Color Monitor - used/tested..$40.

Atari System: 1040STf + SC1435 + Atari Mouse or Marconi Track Ball-all items used/tested.......$100.

Atari PCM124 12" Monitors-New-$20 ea. Original box and manual.
Believe these were used on 286 type computers and Atari's short lived PC. Two units available. 7-Pin video cable.

LYNX STUFF:
LYNX -used but works great except the external speakers do not work. Need headphones to hear audio. $20

LYNX Kit Case-Carry Case-NEW
12"wide 9 1/4" tall 4 1/4" deep-$12

LYNX AC Adapter- New -120V 60Hz-$8

LYNX battery pack-holds 6 'D' Cells-excellent shape.-$8

LYNX NAXI Power Pack-rechargeable, includes A/C charging unit.
Used but ni-cad batteries are in good shape, still hold a good charge. Asking $10.
LYNX Sunshield- $5

*** LYNX GAMES ***
Used but like new
All games have original box and instructions except O.E.M. games listed:

Baseball Heroes...$10
BattleZone 2000...$12
BlockOut.............$10

Blue Lightening.....$15
Hockey.....$10
Joust.....$12
Shanghi.....$12
Steel Talons.....$10
Super Asteroids/Missle Command...$15
Toki.....$10
Warbirds.....$20

O.E.M. Games - full instuctions/no box

Batman Returns...$8
Hard Drivin.....$8
Shadow of the Beast...$8
S.T.U.N. Runner...$8

ST Software: all games are in the box with manuals

Hardball-Accolade-baseball sim-$5
ST Pool-Shelbourne-rack 'em up-$5
Map & Legends-The Cartographer + Data Mao Collection- $10
Gold Rush-Sierra-adventure sim-$5
Flight Simulator II-Sublogic-with Scenery Disk #7-$10
RISK-Virgin-Word conquest game-$5
Their Finest Hour-Lucus Films-The Battle Of Britain-air combat sim-$5
SCRABBLE-Leisure Genius-crossword game-$5
EZ Test Writer-$5
DragonScape-adventure game-$5
Metro Cross-Epyx-scrolling skateboard game-$5
Data Diet-Disk compression program-$5
StarGlider-Firebird-3D combat-air to air/air to ground sim-$5
Final Assault-EPYX-mountain climbing adventure-$5
Transputor-cool 3D marble action game-$5
LED Storm-Road race with lazers-$5
Crash Garrett-1938 adventure game in FRENCH-$5
Championship Wrestling-Epyx-Wrestling Mania for the ST-$5
Phantasm-space shoot-em up-$5
Project Neptune-Epyx-James Bond type adventure-$5
Renegade-Taito-street fighting-cool game-$5
Prime Time-make your own TV shows-$5

Following-no box OR doc's

Warship-Stratigic Simulatons-$2
Read & Rhyme-Unicorn-$2
Math Wizard-Unicorn-$2
The American Pastime Baseball Simulator v3.01-$2

That's All For Now.....
Buyer pays Shipping.
Payment: Check/M.O. or COD, your choice.

3436. PacifiST - new lease on life!

Newsgroup: comp.sys.atari.st
Date: 1998-07-24 00:00:00 UTC
From: Stuart Lyster <lyster@istar.ca>
Message-ID: <01bdb6bf$278b6ee0$edaabfcc@conquest>
Source record: 96407

I sold my Falcon030 in 1996 and bought a DOS box with Win95, but have always missed the world of TOS. However, I just loaded a copy of PacifiST (49b1) onto my Pentium II 300 MHz and have found a new life in Atari. It's good to be back.

Can anyone help me in configuring PacifiST so as to read Drive A? Sometimes DOS does not read my old Atari formatted disks and I cannot transfer files via DOS nor TOS.

Thanks.

> A 6 track mod tracker program. I'm not sure if there are any available for
> the ST, as it has only 4 voices built-in. You will need at least an STE.

The ST only has three voices (and a white noise channel), but when
playing mods they're all used as a DAC playing one sample. The MOD is
actually mixed realtime into one mono-channel on the ST.

The STE has one stereo-channel, i.e. two channels, but the same
technique is used here; the MOD is mixed realtime. This means that on
both the ST and STE you can have lots of channels, but since the STE
doesn't have to use the CPU to play the samples, you can spend more
CPU-time mixing thus getting more channels.

>"tool" is in mint condition.

I can fully understand how you feel. But,I had one time agreed to buy
a SM-124 monitor from one of the on-line auctions, the bid price was
great, but the shipping cost was extremly high I felt, so I paid my
bid price and told the guy to keep it, give it away, or resale in in
the auction as his choice. Shipping any great distance can get
expensive and since I wasn't even sure what contenient you were on,
I didn't want to offer to pay shipping from England, Austrilia or
wherever..

>Such poor response led me to one conclusion. Give it away. (No cost
>to me. No profit to me.) That leaves me two options, give it away to
>a person who is interested enough in it to pay the shipping cost and who

You'll probably have to build one yourself. You can get the connectors
from Maplins, or Conrad electronics, Best Electronics and many other
places. Ask for an Atari 13 pin DIN connector.

Read the docs that come with PaCifiST. Using the A: drive is very
unreliable. You have to use a utility such as makedisk to make disk
images (.st files) of your original disks.

Hi David (and others),

well, who's gonna explain this:

I just got my regular monitor back and now am back on my default res of
832x608 in 32 bit. I resized all the windows of Newsie because of the bigger
screen, and saved prefs and Hey Presto! all windows are saved perfectly and
come back as they were saved! Nothing half height or whatever rubbish, just
perfect... This is running with NVDI 4.12 again (as my card driver).

Otherwise it's the same MagiC etc. etc. etc.

Do we have a wizzard here who can explain what's going on???

I'd recommend TOSBox for serious work as that reads drive A with no
problems. It won't run any games but it seems to run most serious software
fine.

new and hardely used. Sold as a complete set for only $299 plus postage.
Great for the two kids or adult that play like kids <grin>

Includes:

Hardware:

Atari Lynx Unit (qty 2; one older style, one newer style)
Atari Lynx Battery Packs (qty 2)
Full Size Atari Lynx Carry Case (qty 2)
Lynx AC Adapter (qty 2)
All Cables, Manuals, boxes, etc...

Games:

Todd's Adventures In Slime World
Gauntlet, The Third Encounter
Xenophobe
California Games
Batman Returns (x2)
Rygar
Pacland
Dracula, The Undead
Awesome Golf
Kung Food
Rampart
Stun Runner
Robotron 2004
Xybots
Super Asteroids
Missle Command
BattleZone 2000
Pinball Jam
Shadow Of The Beast
Joust

3457. Newsie Mail Folder Reorg?

Newsgroup: comp.sys.atari.st
Date: 1998-07-24 00:00:00 UTC
From: csh@agate.net
Message-ID: <6paorfjmd1@usenet51.supernews.com>
Source record: 96428

Hi,

Am I dreaming, or did I read somewhere that v.90 of Newsie was going to put mail messages in separate folders so that there aren't a billion files in the root of the MAIL folder?

It doesn't seem to be doing it. Is there some option somewhere I'm missing? Right now I have 400+ messages, and it's only gonna get bigger, because I'm superstition about deleting any message that may possibly be useful anytime in the future.

Also, is there a 100 message limit in mailboxes or not? I thought at some point that limitation was fixed, but I have 96 messages in my Outbox, and I'm getting a warning that "Outbox is almost full". What's the deal?

Any help appreciated.

Under the 'Options' menu select 'Local' and enable 'line formatting'. This
should then enable the 'format paragraph' menu entry.

He,

Does someone know the address or email address of Pierre Janssens.
Back in 1992 he was working for the Dutch firm Compenic. I believe he
wrote some Calamus printer drivers. Nowadays he probably still do some
work for Calamus.

TIA
Martin

I noticed that weeks' old postings of mine suddenly appeared again in this NG!

Weird or what!

I did think for a moment that I had resent them, but I know this isn't possible because I'm using a new version of NEWSie and a completely different partition and mail and offline folders to that of a few weeksa ago. If I wasn't I would have been worried that NEWSie had done a wobbly on me!

:-)

Apart from which most of the reposted messages have zero to do with me.

I guess someone or some server has just flipped :-)

It sure does, but you need to edit KILLFILE.TXT to get it working. Read the comments in the KILLFILE.TXT and edit to suit. It really does work, although you're better off using email addresses rather than replyto lines to sort with. I found replyto lines don't always work because they don't contain expected text. Email addresses work just fine.

Actually KILLFILE.TXT is a completely wrong name for such a function, sure you can auto delete mail from spammers and idiots, but you can also transfer mail to separate folders. For instance I have all my CC mails filed to a CARBON.MBX, and that really stops clutter in my main INBOX.MBX.

If you get stuck, yell, and I'll try and help.

Kind regards

Mike Kerslake

From: pmorales@primenet.com
Message-ID: <35b8ab08ee58a1@primenet.com>
Source record: 96435

on Friday 24-07-98 10:43, Jos den Bekker wrote:

>Well, I must be able to understand this first. What is it all about?

Let me try to explain better.

When creating outgoing mail, there is no default in the o.inf file for the from address in the Email header. Instead, it appears that Okami uses either the To: address from the message or the userid/password to which the received Email was addressed. (I guess, ATM, it's not clear to me from which Okami actually picks up the address).

For example, I receive Emails from a mailing list named EDTECH. When receiving these Email, the To: addresss of the message contains

To: EDTECH@H-NET.MSU.EDU

Nowhere does the message contain my Email address (so don't ask me how it gets to me! ;-). To receive this email, I have an entry in my PASSWD file which contains the EDTECH password.

I can force this to my username, pmorales, using POPwatch's ALIAS file, but it is nice having these message in a separate mailbox.

If I reply to this Email, in my outgoing message, I see

From: EDTECH@primenet.com

rather than the correct

From: pmorales@primenet.com

It appears that Okami is using the To: address or PASSWD file to create the From: entry in the header of the file. I'd like the ability to have a default From Address so that my real username, pmorales, is always used in outgoing mail.

Phew! I hope this is more clear.

Thanks,

Pat

3465. FS: Lots of ST stuff--cheap!

Newsgroup: comp.sys.atari.st
Date: 1998-07-24 00:00:00 UTC
From: Chadd Smith <chadd@tquark.pha.jhu.edu>
Message-ID: <Pine.OSF.3.95.980721155031.17523B-100000@tquark.pha.jhu.edu>
Source record: 96436

I have several pieces of Atari ST hardware that I would like
to sell. Unfortunately, it's difficult for me to determine
just how well they work because I don't have a working monitor
to test these on. If you could tell me of an easy way to connect
another type of monitor to these STs, I would greatly appreciate
it.

I don't want to throw these into the garbage or donate them to
a thrift store when someone out there could get much more
use out of them. Just make me an offer--any offer!--and I'll
probably take it, as long as shipping is covered.

Here's the list:

5 Atari 1024ST consoles
1 Atari 520ST console
2 Atari SM124 monitors (they power up, but there is no picture--
one emits a slight burning odor =( )
3 Atari ST mice
1 Atari SF 354 external floppy drive
1 Atari SF 314 external floppy drive
1 Oceanic Master 5-S external floppy drive
1 Hippovision B/W video digitizer card
1 Practical Solutions floppy drive switchbox
a couple of floppy drive cables, an external power supply, some Atari
manuals, reference books, and magazines, and lots of disks (some
original, some copies)

Like I said, right now I have no way of testing these things other
than plugging them in to see if they power up and if the disk drives
start running. All of these used to be in service here in the
Physics department, but they've been collecting dust for a while.
It would be a great little side project to clean them up and test
them, but unfortunately I don't have the time. Most of them are
very clean (one even seems unused), but I need a monitor to really
be sure they work properly.
So if anyone is interested in purchasing any or all of the items above,
make me an offer!

Thanks,
Chadd

The window positions and sizes are usually the last line in PREFS.INF-
the one which starts "windows =..." Try comparing the values before and
after resizing and saving preferences. In an emergency, if you change to
a lower resolution and the window sizing handles disappear off the
screen, you can edit PREFS.INF manually. Take care to preserve all hard
TABs.

So now you have a group called `Mail.edtech'? Then that's your
problem. You shouldn't do it that way. You should create a mailfold
instead, i.e. a group `Mail.pmorales.edtech'. Read the mailfold entry in
the manual and mailfold.inf, to know how to do that.

The default from address in Okami is the login name in the environment
variable `LOGIN', or the variable `login=' in o.inf, but the latter is
only for a single user system. You can set environment variables with
an environment program, or, under MagiC and MiNT, in the MagiC or MiNT
configuration file, or in o.inf by `$NAME=' (in this case:
`$LOGIN=pmorales'). The default from address is overridden when the
group is a Mail group.

Did you set up o.inf correctly ? Look at this:

```
#------------- SETTINGS FOR ALL PROGRAMS ------------------
#
# logname - env var LOGNAME
#
# STATUS:
# UUCP: optional
# SOUP: required
# NOS: optional
# MAUS: optional
# VARIABLES yes
#
# This is the logname of the user on a single user system. If there's
# more than one user, leave this value open and set the current user
# in the env var LOGNAME.
logname=
```

Is it what you're looking for ?

And you can also change it in the write message dialog under the so
called `Login' button.

Bye,
/Pascal/

>Am I dreaming, or did I read somewhere that v.90 of Newsie was going to put
>mail messages in separate folders so that there aren't a billion files in
>the root of the MAIL folder?

Not dreaming but it is implemented differently from 'separate
folders'.

All mail is still held in the /MAIL/ folder and, hence, can become
very large but you have the option of creating new 'mailboxes' which
are, essentially, new mail indexes of the type *.MBX. You can either
use 'Transfer' to file mail away in different boxes or you can use the
facility in the KILLFILE.TXT which allows automatic routing of mail to
different boxes depending on various sort-criteria. Look at the
comments in the recent KILLFILE to see how you can make it work for
you.

>Also, is there a 100 message limit in mailboxes or not? I thought at some
>point that limitation was fixed, but I have 96 messages in my Outbox, and
>I'm getting a warning that "Outbox is almost full". What's the deal?

If you have sufficient RAM you can select Preferences/General/Dynamic
RAM Expansion which will allow you mailbox sizes determined only by
available store.

I've found a problem with browsing with Newsie - clicking on a link produces a blank page only.

If I click on "Source" I can see that the page has been downloaded OK but for some inexplicable reason Newsie doesn't render it.

Offline files seem to display fine, so can anyone point me in the right direction please?

I don't think so. We use the PASSWD file because we like having the ability to receive mail into several mailboxes. Keeps things specifically addressed to Anna separate from mine.

>And you can also change it in the write message dialog under the so
>called `Login' button.

This I missed and might be easier than editing the message Header, which is what I have been doing. The problem is, I have to remember to do it. :(

This all started because we subscribe to mailing lists which validate the From Address in the message before allowing a posting to the list. We have to get the From Address exactly correct or the mail will be rejected.

Thanks,

Pat

3482. What is an Atari these days?

Newsgroup: comp.sys.atari.st
Date: 1998-07-25 00:00:00 UTC
From: Clockmeister <gerryvdb@tnet.com.au>
Message-ID: <01bdb7ee$595e65a0$565e0fcb@default>
Source record: 96360

I used to own a STfm, before switching to Amiga, then PC, then back to Amiga. Anyhow, seeing as I seem to be going full circle I was just wondering what developments have taken place with the ST.
Obviously people are still using these things so I am interested to know who is still developing hardware (accellerators, RAM expansion, graphic cards etc) and software for the platform.

How many users? (approx)
What are ST's used for today (internet and MIDI presumably)
What was the last version of TOS for ST and has it improved much (ie: multitasking) over the early versions (which I found lacking).

What can Atari offer me today over Amiga ?
The reason I ask this is that I'm seriously considering upgrading my A2000 to an 060 and graphics card, maybe PPC if it finally arrives but would like to know if going with an Atari will likely be better and cheaper then upgrading my current setup.

As much as I like my Amiga, it is very expensive to upgrade, but seeing as I wan't to test my artistic capabilities, and there are some excellent new video/graphic apps for it, it's probably worth upgrading it.
Can current Atari's compete in this area?.

I intend to be completely M$ free.

Simply put...
Which platform will give the me the most bang for the buck (spent on upgrading it).

I would appreciate an honest answer as I've been out of the Atari scene for quite some time and I really have no idea what an Atari is capable off, compared to Amiga.

The Milan seems to be overpriced at around $1000, especially for a lowly 040. For the same price I could get a PII, if I wanted to (I don't).
Am I the only one who thinks the Milan seems expensive?.

Thanks,

Clockmeister.

I never have understand this quite well.
What is the exact meaning of single user/multi user system?

>And you can also change it in the write message dialog under the so
>called `Login' button.

What I don't understand is that I do need to call the *Login* buttom and
that I must fill in *tos4ever* otherwise the contents of the *From:*
field will be wrong.
BTW: this is only for mails. With News I don't need to call "login"

In other words if I don't use it I always get this as From: field
From: martin@ping.be
I really don't understand from where Okami gets this.

I don't have a *passwd* file and the logname in *o.inf* is set as
logname=tos4ever

3484. Atari STE et al for sale - Ontario, Canada

Newsgroup: comp.sys.atari.st
Date: 1998-07-25 00:00:00 UTC
From: Dan Vinet <dvinet@sympatico.ca>
Message-ID: <35BA4911.CC55843A@sympatico.ca>
Source record: 96362

To the Atari community at large:

I have been an Atari-ST user now for over a decade, purchasing one
of the first of the ST
machines when they still had TOS on disk and external power supplies.
Ahhhh the memories (sigh)
Anyway, after many upgrades, tweaks, and outright replacements I have
had to knuckle under to
the demands for compatibility at work and now must face the inescapable
- I must sell off much of my
"collection" to pay for a new "PC compatible" machine...

Over the years I have accumulated boxes of ST magazines, hundreds
(if not thousands) of cover
disks and public domain collections, various add-on cards (video and
sound capture for eg.)..
a working 1040 ST.... a couple of monochrome monitors, external
speakers, etc.
The main Items I am trying to sell are:

1/ A Mega STE - upgraded internal 250 meg HD with NVDI and Magic
installed
(I did have a working version of STICK/CAB for internet crusing which
would not take
much tweaking to re-establish)

2/Tons of commercial software with original manuals etc. including
Calamus and the last version
release of Pagestream (my "workhorse" packages)

I am really not that interested in the whole mess of mail orders
etc., and would prefer to deal with
someone who is within driving distance to pick up some/all of the above.
(I live in the London, Ontario
Canada region) -
All offers will be considered, email me at dvinet@sympatic.ca if
interested.

P.S.
I want to thank the participants of this newsgroup for all the
wonderfully helpful posts over the years ..I have not had "write" access
to newsgroups till recently, but from my work I have been able to "read"
these for approx 8 years now - I have been able to solve many ST
troubles thanks to your
collective advise and hints.... thanks...

Cheers to all!!!!

>PASSWD file which contains the EDTECH password.
>
>I can force this to my username, pmorales, using POPwatch's ALIAS
>file, but it is nice having these message in a separate mailbox.

You can use POPwatch's ALIAS file and still have a separate mailbox
for each mailing list (or whatever). In fact, I use ALIAS to make
everything go to OUTRIDER.TXT and I still have about eight different
mailboxes.

That's what Okami's MAILFOLD feature is for. Check out MAILFOLD.INF
and it will show you how to set it up. If you still can't figure it
out, just holler.

3487. A New HD Floppy

Newsgroup: comp.sys.atari.st
Date: 1998-07-25 00:00:00 UTC
From: jimsmith@zetnet.co.uk
Message-ID: <6pdg6l$9da$1@roch.zetnet.co.uk>
Source record: 96365

Hello People.

Having had lots of failures with floppies recently, I decided to treat my Falcon to a new HD drive.
Today I picked up a Samsung and stuck it into place - only to be told that 'Drive A does not exist' when I tried to access a disk. (I had checked that pin 1 on the new mechanism was in the same place as the one on the original so I think I must have had the ribbon connector in the right way round.)
I suspect it must be the 'famous' PC ID problem - but where are the jumpers or switch to change this ? I cannot find any ....

There are lots of numbers on the label, so I shall just list them in the hope that they mean something to someone:

FBS1 P4EJ423340 REV.S1

SFD-321B/EF

Any suggestions or pointers to a Samsung site will be gratefully accepted.

Many Thanks.

Jim.

3489. Possible change in POPwatch - discussion please

Newsgroup: comp.sys.atari.st
Date: 1998-07-25 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <35ba59ca472d40@the-gap.demon.co.uk>
Source record: 96367

This is probably of most interest to people using POPwatch and Okami
together.

POPwatch currently uses the 'To:' field in an email header to determine what
the incoming mail file will be called: ie. gary.txt.
This of course is after it has been looked up and maybe translated via the
ALIAS file.

Some emails have dodgy To: addresses in them ie. from mailing lists etc.
POPwatch unfortunately has to rely on this address, unless running with
Demon Internet's POP3 server, in which case the real SMTP delivery address
is available via the *ENV command.

For those unlucky souls that don't use Demon's server, Jos suggested I
change POPwatch to look for the the top 'Received:' line in an incoming
email and use the email address shown there. It is not always present, and
if that is the case it would then fall back on the To: one as now. If it is
present however, it will be the *real* SMTP delivery address ie. your email
address.

Does anyone think this is a good idea? Or will it just confuse matters?
I don't want to change it, if nobody thinks it's a useful thing.
It does mean that all junk email that is currently addressed badly wouldn't
be filtered out, it would just end up in your real mailbox.

Opinions please?

Gary

On Sat 25-07-98 18:17, Martin Byttebier scribbled:

>I never have understand this quite well.
>What is the exact meaning of single user/multi user system?

Simple. If you're the only user on your system, then you're a single
user system. If more than one person uses your setup, then you have
a multi user system, and you'll need a passwd file.

>In other words if I don't use it I always get this as From: field

Definitely. With POPwatch, I can leave mail adressed to my wife for her
to pick up on her machine, even after looking at it so that she can tell
if it's urgent. She, on the other hand, can't leave any of my mail which
Turnpike (PC/Win95(spit)) insists on downloading.

BTW, any chance of an option which will index incoming emails in an index
corresponding to the addressee, e.g. mail to aprice@.. indexed in APRICE.MBX?

Question: Can DVD-RAM be used on an Atari (Falcon)?

Creative Labs has made their DVD-RAM kit available for $499.95. DVD requires UDF format. Has this been made available for Ataris? One DVD-RAM stores more than 5 Jazz Disks. I guess we need a hardware MPEG-2 decoder for the cartridge port or something inorder to view DVD movies. But for storage, the DVD-RAM sounds great. What do you guys think about it?

RF on both machines are allways a simple way to have a display.
The way for bad results. Also you have a fine picture / bad sound
or good sound and a bad picture. I can't remeber me for ANY Atari
they have a nice picture while use the RF output. That's o for
some low resolution games, not more.

It's better to use a scart connection to the TV (If scart is avaiable)

Scart schematic avaiable in DOITF030

Well, after a bit more experience it seems like for most of us, once your new POPwatch with the default userid entry is released we essentially have this:

* pmorales

in the first line will route all of my mail to me as a single user.

BTW, now that I am using MAILFOLDS, it appears that using only the real userid truly is desirable. The new ALIAS file will allow us to have this. If using the Received line, when present, provides the real userid then this would probably make set up easier while removing some flexibility for those who still want separate userids to be present.

In my experience, maillists can be impossible to keep track of in the To: field of the message. Seems like a new permutation shows up every day. However, because the MAILFOLD allows wildcards in its checks *(thanksfully!)*, the messages are broken out very reliably.

3508. Mupfel script help

Newsgroup: comp.sys.atari.st
Date: 1998-07-26 00:00:00 UTC
From: Jan.De.Smedt@village.uunet.be
Message-ID: <6pfrd6mks1@xenon.inbe.net>
Source record: 96249

Hello,

Since I've got a PalmPilot Pro I can Hotsync it with my Atari (Falcon) running MiNT.
The PPP is a 1 MB RAM Palm computer that comes with a cradle that links to the serial port and W95 soft :-((read on for the solution!)

I want to backup my PPP in a directory that has the name "yymmdd" of today, so e.g. "980726". I do that running Mupfel in MiNT.

How do I get the name for the mkdir command?
Any error checking necessary?

e.g.

```
================ begin script ============================================
# Mupfel script to make a backup
# of the PalmPilot Pro on a Falcon
# OS: MiNT
# v. 1.00 25.07.98 Jan De Smedt
#
#environment:
#
#this activates the Serial port so the Pilot tools can link with the PPP
#setenv PILOTPORT=/dev/modem2
#this sets the port speed
#setenv PILOTRATE=38400
#this is convenient for setting the path, must be Minix to allow LFN's
#setenv PILOTDIR=L:\Pilot\
#setenv PILOTBACKUPDIR= ${PILOTDIR}${USER}\Backup
#
#make the right dir: # here is the problem
#setenv TODAYDIR=$PILOTBACKUPDIR\'Today' # how do I do that?
#mkdir -p $TODAYDIR # so the dir is created if it
#cd $TODAYDIR # does not exist yet

# now, do it:
# clear the screen
echo "%033E"

echo "Backing up $USER's PalmPilot Pro on his Atari..."
echo "using backup dir $TODAYDIR"
echo "now launching 'pilxfer.ttp'...%n"

pilxfer -b $TODAYDIR
echo "Completed successfully, $USER!"
================ end script ==============================================
```

The complete archive to make the connection between your Atari and the PalmPilot Pro or Palm III is a Linux port made by Rodolphe Pineau (thanks Rodolphe!!!) and runs only under MiNT so far, because of the port redirection ($PILOTPORT). If anyone knows how to do the same under MagiC, please let us know.

It can be downloaded on http://www.chez.com/stratos/pilot.htm and is 1.2 MB.

Greetings,
Jan

>
>Whatcha want guvnor ?

I want your brains! I want your typing. I want to give you a little
bit of money, hopefully. Let me explain:

The paper is an attempt to see what kind of interest there is. If I
see a reasonable amount, then I would like to put out other
Atari-related items: memo pads, disk lables and (this is where you
come in) Atari organizers and (kind of) blank books. With a twist
though. I want to include your expertise in them. I'm not rolling in
dough, but I'd give you a little bit of money up-front, and a
percentage of all sales - you would retain the copyright to anything I
use. I'll give details via email. This books are to be handbound
hardcover books, with a variety of covers that should appeal to Atari
enthusiasts.

Even those are just a stepping stone to a full-blown Atari-related
book I hope to begin work on soon. Again, compiled from various
sources, but more general in nature.

Terry

From: ag608@torfree.net
Message-ID: <Ewprnq.Cn2.0.queen@torfree.net>
Source record: 96251

Greetings & Salivations.

I got Pagestream 2.2 a while back and I've got a couple questions. Firstly I can't change the point sizes of text (can't change fonts either) or line objects. Also Text appears one character directly on top of the other instead of normal (like you're reading now). These two things are rather important and don't work as stated in the manual I got from softlogik when I bought the program.

3511. Atari Times Special Edition

Newsgroup: comp.sys.atari.st
Date: 1998-07-26 00:00:00 UTC
From: Colin Polonowski <polonowski@zetnet.co.uk>
Message-ID: <6pfv44$9ue$1@irk.zetnet.co.uk>
Source record: 96252

Hi everyone,

I am currently putting the final touches to a paper based special edition of the Atari Times (UK).

I'm posting this to see how much interest there would be in such a publication.

It currently runs to 44 A5 pages and this edition is focused on tutorials. However, I hope to release further (more generic) special editions if this one is successful.

I'm hoping that it will cost no more than £2 (UKP) inc.postage. I will be making no profit from this venture, I just hope to cover my costs!

If you would be interested in purchasing the Atari Times special edtion, please send me an e-mail and let me know.

Also, if you are able to assist in the distuibution of the Atari Times Special Edition in your country then please let me know.

Cheers,

AFAIK ASH didn't make the Hades MagiC version self. It was another German
firm MW Computer who did it.

The "why not?" would be if it's not economically feasible to do so.

Also, I wonder how well updates to a Milan version would keep up with
the regular MagiC updates, particularly with respect to English
translations. It would suck if MagiC 7 was released, but not for the
Milan.

Well I got PHPlayer and installed it in CAB but I still don't get
sound (testing with the cow.html).

What's the trick?

PHPlayer plays .WAV files from the desktop no problem.

3519. Wdialog & Sting conflict?

Newsgroup: comp.sys.atari.st
Date: 1998-07-26 00:00:00 UTC
From: kennethm@tripnet.se
Message-ID: <35bbab9c28cf6d0@tripnet.se>
Source record: 96260

With Wdialog 2.01 installed neither Popwatch, Newswatch or CAB can make any connections. Sting itself is working perfectly both internally and through masquerading. I can connect perfectly with all three programs on my other computer at the same time as they time out on the the first one. Strange!

This is on a MSTe with Geneva and Neodesk. CAB does work offline with Wdialog installed but I see no difference in CAB with or without it. Is it needed at all with Geneva?

Btw. the other computer is a Stacy without any Wdialog version installed.

Yep, nice to use. Very fast with a ppc mac.
You can use CAB/Iconnect. CAB 2.7 also reads Netscape cache files :)

Forgot games. Forgot APEX and other nice software.
Only 'clean' GEM based Software..

I just got my update a couple of days ago. Maybe I misunderstood, but.....

I had the impression I would be able to read and IBM formatted ZIP cartridge without having to use BigDOS. Am I wrong in this regard?

I have a couple of old Konica KT-510 FDD mechanisms that 7.54 will not format. These are the old Supra FD-10 drives that used the 10 meg floppies. 7.54 reports these units are hard sectored. Are these mechanisms just not supported correctly? I haven't tried formatting with the Supra utils lately.

Lastly, on my Hades, the text does not display properly in any of the dialogs. Text using the system font is too large for the buttons. Looks like the old Atari 800 text. <G> Suggestions?

There is the Milan, Hades, and Pheonix TOS clones.

There is Gemulator, Pacifist, Tosbox, MagiCMAC, and Nostolgia to
emulate an ST on a PC or MAC.

14 Meg F030' can be found for under $500.

Computer Direct (had) a TT060 clone.

We have an excellent browser called CAB, and a great connection
package called STing.

Black Scorpion has the Awesome APEX animation program.

There is more than 1 Atari user left, but less than 5 billion.

To all,

I know I'm taking the risk of sounding completely out of it or stupid but...
Do they still make Atari's? Do they still sell Atari software and accessories?
If so, where can I buy them? If they still make them, where are the Atari
manufacturers located? Where can you get an Atari fixed or serviced? And what
is the "Milan" other than a place in Italy? Please help.

I actually own an Atari 1040ST. That just keeps locking up! Any ideas or
info?
I am looking for a place that will fix them in the U.S., preferably Cleveland
or Chicago.

Confused about this whole "Atari mystery thing",

Elsa

Agreed - if there is no TXT file then the header can't be deleted.

As a temporary work-around you can copy another TXT file to itself, renaming
it to match the number of the missing message.

I don't quite understand this move, Gary. You yourself already point
out the difficulty with mailing lists, but what if the `To:' field
contains multiple adresses? And what do you do with copies, i.e.:

> To: josdb@xs4all.nl
> Cc: gary@the-gap.demon.co.uk

?

Or, worse, with a message that only contains this header:

> To: josdb@xs4all.nl

and still ends up in your mailbox, because it originally had a `Bcc:'
header, which, as you may know, is removed before the message is sent?
I don't think you should scan the `To:' field to find out which user
the message is for.

>For those unlucky souls that don't use Demon's server, Jos suggested I
>change POPwatch to look for the the top 'Received:' line in an incoming
>email and use the email address shown there. It is not always present,

Are you really sure about that? I have never seen Internet messages
without that header, and it wouldn't be wise to exclude the field,
because it is the ONLY way to trace a message.

>It does mean that all junk email that is currently addressed badly wouldn't
>be filtered out, it would just end up in your real mailbox.

Atari Fans! Finally, a great Microsoft product that you can actually use!

Guaranteed not to crash! (Although, it does burn quite well.)

Priceless!
(Slightly higher in Canada)

is pleased to announce the immediate availability of fine, handcrafted writing paper:

100% Hand-made
100% Recycled
100% Post-Microsoft content

OK, not so fine actually. I'm just starting this and am learning as I go - but it's getting better looking every batch, and is perfectly useable writing paper - measuring approximately 8.5x11 inches. Guaranteed to be 100% repulped Microsoft documentation and MS generated printouts. Careless bugs (or features, in Microsoft parlance) and the occasional dog hair (this is a *small* operation, and my huskies like to help me with everything <grin>) included free-of-charge if I happen to miss them.

This is the first in a series of Atari-related (and other alternative operating systems, to a lesser extent) items that I will be making available. I'll have information on these products up on my TDS website soon. This is just an attempt to raise a small amount of capital to enable me to pursue some grander projects.

Contact me for more information on the paper:

tross3@hamtel.tds.net

****
Atari authors/FAQ writers & Compilers - please contact me at the same email address.

Thanks!

Terry Ross
P.S.: Sorry for the cross-post, any complaints please email me directly, to prevent cluttering up the two Newsgroups.

I totally agree with your examples, and fully understand what your saying.
But....
How else should I be doing it (without scanning the received: line)?
At the end of the day, if all else fails you *have* to fall back on the To:
line, surely?? Without access to the SMTP envelope, it's all but impossible
to *accurately* determine the recipient!

>>For those unlucky souls that don't use Demon's server, Jos suggested I
>>change POPwatch to look for the the top 'Received:' line in an incoming
>>email and use the email address shown there. It is not always present,
>
>Are you really sure about that? I have never seen Internet messages
>without that header, and it wouldn't be wise to exclude the field,
>because it is the ONLY way to trace a message.

Yes. I'm not saying that the received: line won't exist.
The RFC's clearly state that it *must* be added by the last SMTP server in
the trip.
But RFC821 clearly states that the *for* bit is optional. I have definately
seen emails that don't include the *for* information. My POP3SMTP server

doesn't include it. Although I've just added it to the TODO list ;-)

----------EXTRACT FROM RFC821------------
The time stamp line and the return path line are formally defined as follows:

<return-path-line> ::= "Return-Path:" <SP><reverse-path><CRLF>

<time-stamp-line> ::= "Received:" <SP> <stamp> <CRLF>

<stamp> ::= <from-domain> <by-domain> <opt-info> ";"
<daytime>

<from-domain> ::= "FROM" <SP> <domain> <SP>

<by-domain> ::= "BY" <SP> <domain> <SP>

<opt-info> ::= [<via>] [<with>] [<id>] [<for>]

<via> ::= "VIA" <SP> <link> <SP>

<with> ::= "WITH" <SP> <protocol> <SP>

<id> ::= "ID" <SP> <string> <SP>

<for> ::= "FOR" <SP> <path> <SP>
---------END OF RFC821 EXTRACT-----------

>>It does mean that all junk email that is currently addressed badly wouldn't
>>be filtered out, it would just end up in your real mailbox.
>
>What doe you mean by this?

Well, some people may *like* to have all emails that have a duff To: line
batched together in a separate mailbox. This is currently possible using the
new ALIAS function in POPwatch 2.70 but if I start using the 'received:'
line then that flexibility would be taken away.

3548. Flight simulators

Newsgroup: comp.sys.atari.st
Date: 1998-07-26 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <901456442.28860.0.spot.c3adfca1@news.demon.nl>
Source record: 96392

Hi enthusiasts!

This time for something completely different...

Wanna talk about flightsims on the Atari platform. Yep, I know there's NG's for that, but they only talk about Flightsim 97 or 98 on the Windoze box, not about stuff on the Atari.
I bet there must be lots "flying around" on the Atari.
Now for the sake of it, I'm not a Mig killer... Unca Lewey is the serious type, so I fly for the sake of flying, not boosting my ego "Hey, I killed 5 more Migs today!"
That means I spent a few thousand hours on flying the ole Flightsim II (by Sublogic), Airbus and Proflight. Guess that makes me a "qualified flightsim pilot".

Now the thing is: docs on all those programs weren't too good, sometimes being not complete (Airbus has more facilities than are being mentioned in the books), so I figure there are people walking around with questions. Even I do have some left...

So maybe the Net is one way to discuss things, but first I wanna know: Who else is flying around? Who's having questions about it too? Just in case there are so many that a separate NG would be justified, we can think of that too... Just for now please react by Email.

Blue Skies,

CU NeXT msg,

```

Atari is finally gone. Purchased by Hasbro. It's my
understanding that Hasbro Representatives will be at
Atari World 98 in Las Vegas (late August) to discuss
their plans for Atari.

Check Atari HQ at <http://www.atarihq.com/> for more info.

Do they still sell Atari software and accessories?
>If so, where can I buy them?

Yes, indeed they do. You can find a list of USA dealers
and servicers at:
<http://www.tmisnet.com/~strads/hq/sources.html#Dealers>.

> If they still make them, where are the Atari
>manufacturers located?

There are several clones in production. Yup, there's a list:
<http://www.tmisnet.com/~strads/hq/clones.html>

> Where can you get an Atari fixed or serviced?

ATY Computer in Oakland California has done good work on my
Falcon. Wizztronics is the "designated repair facility"
IIRC.

You just know there's gotta be a hyperlink:
<http://www.tmisnet.com/~strads/hq/sources.html#Dealers>.

I have big problems with Wdialog.
But i have problem that it crasch randomly CAB and Jinnee.
Using CTRL+C CTRL+X and so on are randomly crasching all processes.
This is not a new problem i had this in versions before 2.01
If i remove wdialog theproblems are gone.

itï¿½s the price for the 040 version. an 060-update is planned to be
released next year. they said it wouldnï¿½t make a big difference in price
whether to start with a 040 and later upgrade to the 060 or to wait
until the 060 is released. but who knows what a "big difference" is ?

Hi!

Guy Harrison <guy@swampdog.demon.co.uk> wrote:
: >#_ENV PATH=;C:\

: If a program can't find something then it can look at this variable to
: try and locate it. The above means "look in the current directory"
: (typically the one the program is running from) then if that fails,
: look in C:\ for it. It is typically used for locating executable files
: and is thus of most use in command line systems or within a compiler
: environment.

$PATH is also used by shel_find() (to locate files) and rsrc_load() (to load .rsc-files). It's therefore possible to include the path given in $HOME in $PATH, too, as it sometimes enables programs which do not officially support $HOME to find their .inf-files in this directory as well. Of course, for this to work you'll have to save options once and then copy the files over to $HOME. If the application then still finds them, it uses shel_find() to locate them, and is therefore "tricked" into supporting $HOME by faking $PATH.

And don't worry: Including the homedir into $PATH won't cause any harm.

Ciao

Thomas

> or switch to change this ? I cannot find any ....

On most modern drives, they've got rid of the jumpers, probably to gain
$0.000000001 on production costs. Chances are, however, that the option
of setting the drive ID number is still there somewhere on the board,
probably under the form of an open solderpad on the drive's PCB. The
trouble is, finding the correct solderpad.

The way NOT to do it, is to open up the drive, and try shorting each
suspected solderpad with a screwdriver. Look for one with a marking like
"ID" or "D0/D1" or something like that. This is really the "I got
nothing to lose" approach.

I did this with my Mitsumi, and was lucky enough to find the right pad
before blowing up the drive or the machine.

I'm afraid I can't suggest any correct way to do it, without getting the
PCB data from Samsung.

Cheers,
Nick

I must admit that I did spend a lot of time buzzing around in FSII on
the ST. I even did a transatlic flight with the learjet and bought the
northern europe scenery disk.

There were a few hidden features in that version. The US had a
non-documented Seattle area, and I once found a tiny little lake
somewhere in between New York and Chicago. You could also do some neat
things like making an atmospheric re-entry with the Cessna.

I bought a quite good book at the time, that I still have where it
talked about PC/Mac and Atari versions of FSII. Sadly it was edited by
"Microsoft press".

Cheers,
Nick

Yes, they are crude Bitmap files - no compression or anything so they
are enormous.

I use Imagecopy to display any of these that I get but I'm sure other
graphics progs (SMURF, GEMview etc.) would deal with them.

> either) or line objects.

First, are you using the last 2.2b release?
Are you sure the font sizes are not changed in the printed doc, or do you mean they don't seem to change onscreen? There is a big difference between the way Pagestream shows fonts on the screen, and the way they actually print out. The font dialog box seems a little flakey to me. Sometimes the font selector defaults to the last selected font, and sometimes it defaults to the last font used after clicking "Save Settings". Also having some bad font files will cause this behavior.

> Also Text appears one character directly on top
> of the other instead of normal (like you're reading now). These two

Have you checked out the line and character spacing menu item? Does this happen with all fonts, some fonts, or just one font?

Hello Everybody,

I recently load the August release of Eureka 2.12 on my page.
It's a 2D Graph Describer and a 3D Modeller. The main
update in this release is the Gouraud Shadind. I've
also uploaded it on funet.fi , Belgian FTP site of RMA,
and tu-berlin.de. I tried for several times to upload
it on atari.archive.umich.edu with no success. There's
always a time out. Umich FTP doesn't seem to work.
Have fun with Eureka,
Bye for now,

> Quite impressive, if this list is anything to go by?

OK, N.AES & NVDI should be expected to run on any kind of TOS clone. But has anyone tried Freeze Dried Terminal on a Milan? FDT was not supposed to run on a Falcon, but I've been doing just that for 3 or 4 years. FDT thinks its in some sort of 16 color TT mode. TT medium?? Also it was written in GFA Basic, but it runs much better on my Falcon in 16 color mode, than it runs in ST Med or High for which it was written and tested on.

I know this FDT software will never be updated, but I hope the Milan will keep up with the software! :-)

No, Gary, you should *never* use the `To:' field to determine who the message is for. Never ever. If you don't have access to the (E)SMTP envelope, or if there's no `Received:' header with `for:' information, then you should relegate the message(s) to a mailbox called `postmaster', or, maybe, `junk'. Any filtering should be done *after* the messages have been properly enveloped, and I think it stands to reason to filter on the `From:', or `Reply-To:', or `Sender:' fields. If you filter in advance on the `To:' field, you might lose important mail.

>Yes. I'm not saying that the received: line won't exist.

>But RFC821 clearly states that the *for* bit is optional.

I do not read in the extract you give that `for' is any more optional than the other fields.

>I have definately
>seen emails that don't include the *for* information.

Not anywhere? Are you sure? Very often there are at least three `Received:' fields, and not all of them contain the `for' field. But *none* of them?

>My POP3SMTP server
>doesn't include it. Although I've just added it to the TODO list ;-)

SCART is a european standard connector, also called Peritel, that
includes RGB and composite input and output signals. It is standard on
all euro TVs since the 80's. It is a wierd shaped rectangular connector
that looks something like this:

```
____________
|: : : : : /
| : : : : :|
```

I don't know what you call "cable inputs", but maybe you have an RGB
signal input somewhere that you can use. RGB is always better than
composite.

Have a look at the pinout section of the Quick FAQ.

Both yes and no. You can't just read any PC-formatted Zip, but you can partition them to be "TOS+DOS"-compatible. I use this myself to transfer stuff between my Falcon (HD-Driver 7.12) and the NT-box at work. No problems at all, and with MiNT 1.15 long filenames work as well. Read the manual well so you're sure you understand how it works though.

> Lastly, on my Hades, the text does not display properly in any of the

What OS? TOS, MultiTOS, MagiC, N.AES...? Have you checked STA_VDI.INF, it's possible to specify the width and height of the display so fonts are scaled correctly (e.g. a 10pt font is really 10pt, regardless of the size of your monitor). If this is messed up you might get some funny results.

Atari Portfolio
PC Card Drive interface (uses ISA slot) in box with extra Drive
3 BRAND NEW 64k memory cards in sealed Atari Box
1 USED 64K Memory Card in Atari Box (ACOM on card)
Serial interface in box with German Instructions
Genuine power supply in box
One Portfolio, Broken, LCD isnt working right, it works when you open
the screen slightly however turns off when you open the screen fully.
One Portfolio, LCD removed, machine should work o.k.
I would assume both Portfolio's are easily fixable, especially the one
with the screen still on, it is probably just a *small* problem which
someone with electronic experience could fix, I however do not have this
experience, I havent even opened it up. If you purchased all of
accessories from a supplier you would be looking to pay over 250.00 not
to mention the probably easily fixable machines.

You can bid on this at:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=22908158

GOOD LUCK!

>Is this the DTE speed. I'm set at 115,000

If you have a 33k6 modem I think it will have a maximum peak at around 70kbps, but then again, you won't see much difference if set at 56k7, and you'll probably have a more reliable connection too. My Falcon refuses to work with the modem if I set it at 115k2 and use a 33k6 modem.

>>2: modem speed = the physical connection between your and your ISP, for

>Is this the DCE, this is set at 33.6.

If you have a 33k6 modem it's the best you'll get. But as somebody else in this thread said , this is taken care of by the modem if you haven't put some of the other speeds too low. Good modems even have fallback, if the high speed is resulting in a lot of errors both modems will step down a little bit to see if it's more reliable.

>>3: connection speed = the teorethical connection, actual data troughput that

>Can you really get a connection above 28.8?

With a 33k6 modem the best would be to have a port speed at 56k7 and get connections at 56k7. Shouldn't be any problems there really. With 56k7 modems you could actually get connections at 70kbps.

>>4: the source = if the data to you is sent by 2000bytes/s, no matter how

>I use Bellsouth.net. I would assume that they have the most state of

>beans) before the other 50k of the file is sent. Could it be than my
>F030 just doesn't have enough power to sustain a fast transfer. I
>have transferred via FTP 1 meg files at over 3500.

The F030 has the power to keep transferring at the highest rate you have get during a session. It only slows down while processing images and doing layout and displaying. The best would be to use a ping program and first check what speeds you get to your ISP, then to the host of the pages. If the connection to your ISP is ok then you'll know it's not your equipment that's failing.

BTW, what TCP/IP stack do you use? I-Connect or STiNG/STiK? Or perhaps some MiNT stuff?

The Falcon seems to be quite "trial-and-error" forgiveful. I connected my internal IDE in every way possible when it broke down ... it powered up/down as it felt like and me and my Falcon got angry with each other and nothing worked in over a year ... but when I started looking at the problem and brought great gifts as HD Driver to my Falcon we are now friends again, AND the crashed 2.5" IDE is working again!!! Not that I think it's reliable but when I got the damaged parts (where the drive's head started plouging into the media) marked bad and untouchable it has worked to 100%.

>WARNING - never buy a drive without cables, never try to fit an internal
component
>after 3 glasses of wine, don't belive the Titan IDE fitting kit will

Good, the modem works.

>What happens it, when i try to dial, it doesnt actually
>dial, the dial tone just comes up and it hangs there.

At least it receives your Hayes-AT commands which means it's all an issue of configuration.

>So what do I have to do? Im thinking some modem settings
>for windows are confusing it? I tried ATZ but nothing..

Open a terminal window so that you can "talk" directly to the modem and ask if it' s there by typing "AT"and press enter. If the modem answers "OK" it's just to recall all factory defaults with "AT&F" and then dial the number by "ATDT xxxxxx". Then you shoul dfinally get a "CONNECT AT modemspeed" message. If that's ok you must store the profile in the modem's memory with an AT-command that you'll find in every modem-manual.

If this isn't ok, you probably have your comms program set up wrongly. I think your whole problem is that your comms program is waiting for this "CONNECT" message, and the modem is set to just send status codes.

I had the same problem and that was ALL due to electrical ground/earth problems. Some houses seems to even have the antenna earth and electrical earth connected to really get interfereance all over. Make sure you have no antenna connection in a SCART-connected video or a split/join box and see if the picture get's better. Also you can try to connect both your Atari and the TV to sockets without earth. This antenna problem of mine was there when I connected my Atari by SCART and the house-antenna to the TV.

I have a Lighthouse tower too, and seen the expansion box option in the manual, but I think it must only be a matter of extending the bus with cable and connectors, than it is a problem of the devices to share the bus without conflicts.

From: dlormand@aztec.asu.edu
Message-ID: <6pihfj$qo3$1@news.asu.edu>
Source record: 96314

Hello, Atarians,
I have been in the Atari world for maybe 5 years now,
and I observe a phenomenon that I also see in my native
TI world, regarding descriptions of software packages for
potential buyers/users. in the case of FTP sites, you can
get the index, which tells you in a thumbnail what a program
does, so you can search for things that do sort of what you
want. In the case of SW or PD found on anonymous FTP sites,
that is usually good enough to pull something down and try
it, and if it doesn't do what you wanted, fine. But consider
the case with commercial software:

1. It is (and should be) available from vendors or private
owners, but you pay money for it and wait for it to arrive;
except in rare cases where there is a PD demo on the 'Net,
you don't know whether the program is really what you want
until you get it. Now, if they were available in a store
(like they used to be) and you could handle the box, look
at the graphics, and read the blurbs, you could derive SOME
info about the program.

2. These sources almost universally provide nothing more
than the name of the program. Except for "Game", "Text
Editor", or even "Utility", you have very little clue
what the program does. This is even less than the index
on FTP sites! Are there descriptions of what these programs
are anywheres out there?

3. Possibly most of these commercial games had been reviewed
in a paper magazine long ago. Granted, sometimes these magazines
are available from the same vendors/previous owners, but it
would be awfully roundabout to buy a handful of magazines in order
to look through the reviews/advertisements in the hope of finding
out more about a program offered name-only on the 'Net.

So I have a question and a proposal:
Is there a resource that describes what a program does, hopefully in
greater detail than an FTP site index, for most of the programs
created for commercial sale for the Atari ST?

OR, if people are scrambling about what to put in their 'Netzines
or even hardcopy magazines (and would like to attract subscriptions
from the newcomers), howsabout reviews of old commercial programs,
even if you know these same programs had already been reviewed
ten years ago in "ST User" or whatever.

>*Preferences -> Edit user*
>you can see a nice window with a field "Account:". When retrieving post
>take a username from this field :-)

Actually that *isn't* simple at all :-(

My *Account* field has my domain name in it, not my user name. eg.
the-gap. This is a peculiarity of Demon Internet I guess, but it allows me
to access *all* emails for @the-gap. eg. stik@the-gap, gary@the-gap etc.
If I put in gary@the-gap, then I can only access emails for gary.

The last thing I want to do is change POPwatch, so that it's *less* useful
to me personally.

Gary

>But how did you get that name in the first place?

Well this is a remain from the time I was using Oasis 1.35. At that time
my email address was martin.byttebier@ping.be. I also wasn't aware of the
use of *alias* so my mails were retrieved as martin.byt or something
like that.
That's why I called my mailbox *someone*. My alias contained only one
entry at that time
default delivery
Postmaster someone

With the switch over to Okami I thought it was time for a more suitable
mailbox name so I took *martin*. It never occured to me that this was the
culprit of the all the troubles I was facing at.
Thank you again.

>If i remove wdialog theproblems are gone.

Wdialog before 2.01 had a bug which caused severe troubles with N.AES.
Wdialog 2.01 seems to work but if I don't need it I don't use it because
Wdialog has still another bug which cause a dialog prob with Thing 1.26.
If one load wdialog before Thing the text in Thing's dialog boxes
aren't visible. This can be solved by either do a reload of Thing or
either start Wdialog from Thing.

Generaly for the most applications one doesn't need wdialog at all.
Even the latest Papillon version doesn't need it in order to work (it need
NVDI5 however) but ofcourse you loose the ability to print.
I only use wdialog if I want to print something from Cab although one can
print without.

Yes, Gemview can handle the *.BMP-Files which are common on
the PC! By the way: Gemview is a great program (a little bit
slow), supporting the most image-files I think. You can also
convert images into other formats.

Hello,

I've got a lot of old Atari ST disks laying around: some apps, some STart and ST Format disks, and some home-brewed. All are double-density; most double-sided.

I would like to create some disk images of these (assuming they are still good), but I have two problems.

1) I don't what software to use to make mountable ST disk images;

2) The only ST I have is an old 520 with one single-sided drive. I also have a Mac, but many of the disks are in Atari format, and can't be read from the Mac's Finder. Any suggestions on how I can access these disks? Will MagiCMac (demo; I don't have the full program), PowerST, or NoSTalgia read these from the Mac's floppy drive? I also have access to a Windows PC at work, but that makes getting the images back on my Mac a lot harder.

Please respond in email (<mailto:tjh@ic.net>), as I won't be able to check this newsgroup for a week or so.

Thanks in advance,

Tom

Howdy!

You know that you can add random foot lines (taglines) in your signature
with Okami. I'm quite sure some of you love this feature in Led as I do.
I've just done a proggy for this, with Led in mind. Therefore it is able
to use the same file(s) as Led. You can use different files too, for
different areas... oups! newsgroups ;-)

If anybody want to see it...

Now it works without any changes from my side of the keyboard! Maybe a
good night's sleep and a cold boot in the morning did the trick?

But I do not see any significant differences with Wdialog installed. The
only thing I have noticed is the new options in the print dialogue in
CAB.

3605. WTB: Speedo fonts for Atari

Newsgroup: comp.sys.atari.st
Date: 1998-07-27 00:00:00 UTC
From: Richard A Carsons <richard@raccon.demon.co.uk>
Message-ID: <QR7SmpApsNv1EwGu@raccon.demon.co.uk>
Source record: 96326
Cross-posted to: comp.sys.atari.st,demon.adverts

When COMPO were alive and well, they sold 2 CD-ROMs of Speedo fonts to go alongside (amongst other things) That's Write 3 for the Atari STe.

Does anyone have these CDs who might be prepared to sell them at a reasonable figure? The fonts were I think also on disk but I would prefer CD.

TIA

3610. Printing from CAB

Newsgroup: comp.sys.atari.st
Date: 1998-07-27 00:00:00 UTC
From: kenkel@zetnet.co.uk
Message-ID: <6pj1kh$e7q$1@irk.zetnet.co.uk>
Source record: 96331

Hello,

I own the fully functional commercial version of CAB 2.5 and the manual states that printing requires NVDI 3/4 or later, or GDOS. For now, I'm using an old NVDI release (2.00). However, I've tried GDOS without success. Perhaps later versions of CAB (is 2.6 out yet) will not require these additions. Meanwhile, I've been trying to figure out if there is any way round the problem for now - I know that WDIALOG may also be involved, though I think that is in addition to NVDI. If anyone has any comments on the setup, I'd be most interested.

Thanks as always,
EDK

I have a ATI 64 using the same driver. I need to install NVDI anyway.

Perhaps Uwe forgot something in the new version. I didn't have this
problem in 6.22

Bummer. I was hoping to be able to just pop the zip in. But as I poke
through the new docs, I get the impression I'm limited to DOS
partitions of 32 megs in size. Which is too small for my needs.

It's the modified 3.06 TOS used in the Hades. And the font problem is
ONLY in this program, no others that I use. And as I mentioned in a
different post, it was not a problem in 6.22.

Thinking about the STA_VDI.INF, if that was the problem, wouldn't the
font display be incorrect in any program?

I tried to get the info from Mitsumi at the time, but unsuccessfully.
The reason is probably that users are not meant to fiddle with
solderpads on the PCB.

Cheers,
Nick

Is there any special reason you are using your Falcon with a TV (the worst possible display), rather than a monitor? With the appropriate "monitor block" adapter, the Falcon can use either a standard color VGA monitor (which I have seen going used for as little as $40 on the net), an SC1224, or a composite color monitor.

That said, for your present setup, I doubt a RF filter would help. Although I have never used the RF output from the Falcon, the RF output from the old ST's was not the best, and I suspect it did not improve with the Falcon. You may have to live with the problem, until you can get a monitor.

If your TV supports audio/video inputs, getting the composite output monitor block for your Falcon (or hacking one in directly, if you are comfortable with a soldering iron and the innards of computers) should greatly reduce interference. Even without A/V inputs, being able to route the video through your VCR, and use it's modulator instead (which is typically better quality and/or less "noisy" than those built into computers) should give a boost in quality.

Having never heard before of any 1040ST(f) with a single-sided drive, I
would have to say I believe what you saw did not ship from the factory
that way. Either someone had replaced the drive mech, or more likely, put
a 1040ST badge or case top on a 520STfm with a single-sided drive.

I have to admit, even if the drum lasts only a fraction of the time mine did, you should get your money's worth out of it. <grin>

> This one had a ram upgrade in it, but it wouldn't work, until
> after I removed the upgrade, now it's fine. I can pint up to a
> 5x5 print before the memory error shows up. So it's good for
> small test prints and text.

Hmmm...while mine has 1 meg of memory (twice the base amount), the only problem I got an out of memory error was with a large document that had softloaded fonts (once I changed to send the entire page as a bitmap, all was fine).

Unless you are doing some intense graphic work, you should be getting at least half a page, if not more.

I still have not determined what to do with mine. The electronics are fine, and I have the optional serial port I purchased and have not yet installed in it. A new drum will cost at least $155, however, which is more than I paid for my refurbed Okidata OL600e, and there is no guarantee that a new drum would last any longer. With the OL600e, no only are the drums less expensive, but I can buy them refurbed, which is not an option with the Brother.

What would really make my day is finding a really cheap HL-600 series printer, just as you did, even if the electronics were fried, as long as it had a good drum.

I have the same problem with Gemjing. Do you use a single tasking
operating system (a regular TOS version) and not something like MagiC
(multi tasking). I have understood that is our problem. I heard the
trick only works under Multi tasking.
Can anyone in this newsgroup confirm this ?

Either A or B are cheaper (or the "Upgrade to an STE and add 4Mb RAM"
option that you overlooked) , but won't get you past the 19.200 bps
limit.

A Falcon will probably be the best for internet access.

The PC route is a long road where you'll be spending $500 every 6 months
just to keep your machine running.

> Concerns:
> A) Can Falcon run my existing ST programs or do I need special versions?

It depends what. Some games will not run. Some games will run, but only
with an STE emulator. Most 'serious' applications will run without any
problem.

Cheers,
Nick

Hej Erik, Hallo Martin,

I'm still wondering, does Jinnee still need Wdialog now when running MagiC 6?
I checked out the program some time ago when it was first released, the docs
said that running from MagiC (then at v. 5.20 I believe) you didn't need
Wdialog, but running without MagiC you did. Well, I have only MagiC 5.01 and
it refused to start (AES error message). With Wdialog it went OK.
Right now I'm up to 2.0 (got the E version including extensive docs in
english) with Wdialog. No problems yet. It runs from the Autofolder, pretty
to the end, where Sting still sits last.
While I'm on the subject, are there any english RSC files for Jinnee yet?

Hi,

once more I focus your attention on Graftool, it's shareware (the fee is zero but register just to kick the limitations out). It loads masses of formats too and is FAST.

Sadly, Gemview only saves in the graphic mode you are using, so you can't save a pic in truecolor when running in 16 color mode... Graftool does just that!
On the other hand, Graftool refuses to load corrupted JPG's, where Gemview will show them. I've "fixed" lotsa JPG's with "rubbish in the bottom" using Gemview.

DOS-partitions are limitited to 32Mb, "TOS + DOS" can be a lot bigger.
But you can only have one partition on each media (e.g. a 96Mb Zip) as
the partition-scheme for TOS and DOS is different with partitions
larger than 32Mb. I have all my Zips partitioned with one 96Mb TOS+DOS
partition and it works perfectly on both the NT-box and my Falcon.

> It's the modified 3.06 TOS used in the Hades. And the font problem is
> ONLY in this program, no others that I use. And as I mentioned in a
> different post, it was not a problem in 6.22.

Hmmm... I have serious problems with HD-Driver on TOS 2.06 (Mega ST)
and 3.06 (TT). HD-Driver itself works fine, and if I use MiNT, MagiC
or Geneave there are no problems either. But if I try to boot directly
to TOS I get a message saying "error allocating window memory" (Or
something like that). If I configure the desktop to autostart a
program it works, but as soon as the program exits to the desktop I
get this message. I guess there is some sort of conflict between
HD-Driver and the desktop in TOS 2/3.

Btw. if HD-Driver doesn't log any drives at boot-time I can get to the
desktop with no problems. And if I boot with a floppy and start
HD-Driver from the desktop then it also works fine. I have only tested
7.10 and upwards on the Mega and TT.

> Thinking about the STA_VDI.INF, if that was the problem, wouldn't the

In the US, most new TV's have the coaxial cable input that is for your cable, or antenea. The other input is regular composite video.

It only happens with the Falcon, my STe doesn't have the interference. But they both have that dingy appearance when using the RF out. I'm in the US and I don't think we have SCART. You gave me a good idea though! I noticed that the power supply on the STe has a magnet wrapped around one of the wires, so does the external hard floppy drive. The F030 doesn't. I guess the interference may be due to the power supply.

There is someone in thisa newsgroup offering a 14 meg Falcon for $550.
If you are looking to just stay connected, cruise the net in color,
type letters, send e-mail, look at a few pictures, then the Falcon
should suit you. It is a bit slow on the net, but you can turn off
the pictures to speed it up. The Apex viewers give you a nice display
of Jpeg's and is really quite fast. You also have over 12 years of
software out there to use. We even have a DOOM emulator. To upgrade
a regular ST is not worth the effort, at least the STe can be bumped
up to 4 megs for $40(us)

SCART is sort of a standard for connecting VCR's to TV's, at least in Europe, but it's hard to say about the states. Your problem could be due to that there's no magnet or simply that some wire is too close to some electromagnetically interfering object. But I would still experiment with the earth/ground of the power and antenna to the TV and the Falcon.

>The last thing I want to do is change POPwatch, so that it's *less* useful
>to me personally.

You don't have to do that, but you have the perfect solution for
everybody right under your nose, it's handed to you, your users, and
everyboy else in the universe on a silver, nay gold, platter. :)

Let's first review the possibilities.

If a user doesn't have his or her own site, like me, then there's only
one mailbox and mail addressed to another user will either be bounced
or end up in the wrong mailbox. So all that user has to do is collect
mail for user@site.domain, that's the only mail there will ever be
for him/her.

If, however, a user does have his/her own site, mail can be received
for, in principle, an infinite amount of users. BUT - and this a big
BUT - the owner of the site of course *knows* which users there are,
so he/she instructs POPwatch to fetch mail for user1, user2, etc
(there are of course always two default users: `root' and
`postmaster'), deletes them on the host, and saves them on his/her
local disk as user1.txt, user2.txt, etc. Now if perchance there is
also (junk) mail for a user the owner of the site does *not* know,
there is no possibility - there never can be - to get it if you don't
have access to the envelope (as you do with demon). So you either have
to leave it uncollected, or get it by issuing the command `USER site'
to the POP3 server in the authorization state. If this fails, then you
can't get at it, but that is simply the present situation. You can
save that mail to a file called `junk.txt', or append it to
`postmaster.txt'.

Filtering, if any, should be done *after* deciding which `user.txt'
file the mail you are going to get is for.

I'd agree that this does serve some usefulness. However, the important thing is to concentrate on new releases. If you want to know about an old program there is most likely someone in this group who can give you an informed opinion.

However, I'd love to get any and all submissions :-).

Just thought it worth mentioning that a serial port upgrade is fairly
cheap (mine cost about £20!) and will allow your modem to operate at
maximum capacity BUT.....remember that 56k is what your modem can
handle - the download speed from the internet is nowhere near as fast
(I find that during times of low traffic, I can manage about 3.6k
bps).

Cheers,
EDK

Your best bet is C. Find a second-hand Falcon. This is not only fast
enough but also has the required screen resolutions for the web.

>Concerns:
>A) Can Falcon run my existing ST programs or do I need special versions?

Don't worry - the VAST majority of ST programs run on the Falc.

Well I'm using Image Copy to print out Jpgs and if I go over a
5x5 print it tells me on the next sheet of paper

'out of memory upgrade' Oh BTW, I'm into my 3rd ream of paper, I
figured I might as will give it an acid test and I printed out a
bunch of flyers and a newsletter on it along with a ton of text
files I've wanted to print out. So far the only thing is that
after a night of sitting cold, the 1st sheet of paper has a
wheel mark for anout an inch, the rest of the day everything has
been good.

I'm think of writting to Brothers and see what it would cost me
to have them check out the ram board that had been added in, to
me it looks like there's a missing chip on it.

Ofcourse, in the morrning when I get up and before I wake it up
outta sleep mode, I take a sheet of test print and over a

blazing bed of coals (BBQ type) I give it up to the big printer
god in the sky! ;} Oh ya,it came with a 2nd toner cart too!
Unopened even! Shear Dumb Luck!

>However, I'd love to get any and all submissions :-).

Hi, Scott! Subscribing to the Informer is high on my list of
Things To Do In The Near Future!

Certainly a magazine should never preempt a review of a new
product in favour of a "historical" piece. I would suspect there's
room for both. But I've been reading posts from Atari 'Netzine
editors who were simply weeping for submissions!

I would tend to prefer a "FAQ" like entity, a "standard reference
work" that could grow as people (such as those with something
to sell!) contributed descriptions of programs.

The problem with asking questions about titles is, it helps just
me, just right now. I would like to see something useful for
newbies in general. Also, asking questions about a title doesn't
do me any good for browsing catalogs and For Sale notices.
For instance, when Bravo Sierra posts an ad, and you get his
catalog and it isn't anything more than a list of titles,
sure, I'd like to support an Atari vendor, but I haven't a clue
what these things are, other than "Games", "Productivity", etc.
When I see a post here about "F/S: Software" and I look, and
it's just a bunch of titles, I would like a guide to what these
things are, to see if I really would want to buy any.

If they were downloaded on a PC you could allways unpack the .zip
archive there and repack it. This would be very fast if you have a
pentium pc.

But the only proper way would be to find where in the process the .zip
file becomes corrupt. When you are downloading with z-modem there are
internal crc's to check the data. When you transfer to and from floppy
crc's are also used. So somwhere something is wrong. I would suspect the
z-modem download (presuming you are using "rz" at a unix prompt). Check
that it is set up (on the pc) for retransmitting of packets with crc
errors.

I once had troubles with files getting bit-errors. Sometimes a 1 would
become a 0. This was with my old Mega 2 especially when I had the Pro-24
cartridge installed. Later I found that this was due to a hardware flaw
in the Mega. This was very frustrating and killed some projects I was
working on. So there is a possibility that any of the involved computers
has hardware problems. I have also had a few cases when files got
corrupted without any warning when copying from Win-95 to my MSTe with
HD floppy. Checked this with ï¿½gale but I could not find what was causing
the error. Who knows if Windows is actually telling you there where
errors when writing to disk (like some fast copying programs on Atari
can be set to do) by proof reading after writing.

A better way would be to give Newswatch, Popwatch and Okami with Sting a
second try. Sting is often (if your provider has a "modern" setup) very
easy to setup. You simply have to enter your account, name and password
and (almost) everything else is done by the ppp negotiation.

SNIP.

When sending my last reply to this post Okami terminated with a bus
error. After checking with EDGE.PRG I lost 72 clusters with two files in
directories I have not visited since the last time i checked the hd.
This could very well be because I use TCACHE with delayed write. The
post itself did survive the crash however. I look forward to see if the
same will happen this time too :-)

Greetings from a Okami user who has temporarily turned the delayed write
off!

Over 200 headers with no TXT files arrived last weekend and this:
my solution was to delve into the various ng folders and remove the
rogue references from XOVER.TXT, making sure the editor (EdHak) had
```

a sufficiently wide right margin (by adding some 00 to the config)
to prevent wrapping (which causes nonsense to appear in the headers
window).

3651. Web Browser for Atari ST?

Newsgroup: comp.sys.atari.st
Date: 1998-07-28 00:00:00 UTC
From: Douglas Cowan <d.cowan@SPAMDIEukonline.co.uk>
Message-ID: <01bdba74$375c2400$LocalHost@default>
Source record: 96178

Hello people,

As a former Atari ST user (now a P200 3DFX user) I decided for the sake of nostalgia that I'd try connecting my 33.6Kbps modem to my Atari some-time, and try browsing the web on it.

Problem is, I don't know what software I need to make use of my 1MB STFM on the 'net -- no doubt I need some sort of dial-up system, and a mass of stuff to set up *sigh*.

Anyway, if anyone can help me on my first venture on an Atari for several years, it'd be much appreciated ;)

If you could reply to my email address as well as the newsgroup, it'd be helpful. :)

Douglas Cowan

>It's like the answer to *MOST* graphics problems on the Atari
>Platform. IMAGECOPY!!

Very true. The good thing about Image Copy is that it reads and writes lots of formats, it's actively supported and it runs on any Atari system. I've used it for many years now, starting with a bog basic 1/2 Mb STFM right up to a Falcon.

>Contact the ST club at stclub@cix.compulink.co.uk
>
>Imagecopy will display .BMP files and convert them to any number of
>other more "friendly" formats.

It even gives the right extension to wrongly named files after a warning/choice to the user.

If you use graphics a lot, then Image Copy is probably one of the best investments you can make in this department. Certainly producing Atari Computing magazine wouldn't be so easy without the program. I use it for everything!

It is a complex program below the surface and you do need to make sure that your settings are correct, otherwise you'll get 'scrambled egg' results like TG's, but the manual is very detailed.

Kind regards

Mike Kerslake

JPEGTRAN will do that, also, and without losing any picture
information. I'm assuming your copying or saving from Gemview, and
everytime you load and re-save a JPEG, you're losing info. JPEGTRAN
gets around that (albeit without the flexibility you might get with
Gemview).

Nope. The only North American distributor is Computer Direct - this comes directly from Titan. And Computer Direct is waiting to get them from Titan, who is waiting to get them from their supplier - which means I continue to wait on both of them!

The good news is SFT finally got MagiC 5 back in stock - and I got my copy - although I haven't had the time to install / try it out yet...

I'll keep you posted.

3658. Keyboard fix?

Newsgroup: comp.sys.atari.st
Date: 1998-07-28 00:00:00 UTC
From: <>
Message-ID: <35bdd7c4.0@news.ptw.com>
Source record: 96185

I have once more taken my TT keyboard apart, I belive I found the break in the track that comes from the control key, it's up in the left hand corner, I tried putting a wire cross it and taping it down. Don't work, so I'm wondering if a trick from the old 8-bit days would work? I remember having to use silver paint to fix a keypress on the old 1200XL keyboard when a key wore out. I'm thinking that maybe on friday when I get my v.a. something like siver paint or that lq silver for other fixs might do the job? I' not going to get anything hot near this membrain and end up distroying it.

BTW, if anyone has the Best Elec. catalog, can you look up the parts number and price for the membrain for the TT keyboard in case I end up having to order it?

Does the manual mention an e-mail address that questions can be directed to? I sent a question to the ASH address on their web page and they sent me to Toad Computers who could not answer anything for me.

Can it use Open Transport, or must I use standard Atari connectivity? Your
message suggests OT works, another one suggests it doesn't.

Thanks,

If I understand this correctly, I should be able to take and IBM formatted zip cart, reformat to "TOS + DOS", and do what I want, just pop it in a Windows machine. Which would be no big deal.

I'll look in the docs on the HDDRIVER disk and see what I can find out about this. The only thing thing the Systems Solutions manual talks about is the Symbios Logic SCSI BIOS, and I can't be sure every machine I'll be using will have that BIOS.

Systems Solutions manuals leave a lot to be desired, IMHO. :-(

3666. Atari Upgrade Question / Thoughts ?

Newsgroup: comp.sys.atari.st
Date: 1998-07-28 00:00:00 UTC
From: SRipkowski@my-dejanews.com
Message-ID: <6pjitaiad1@nnrp1.dejanews.com>
Source record: 96340

After abondoning the Wintel platform 1.5 years ago and relying on the trusty 8 bit, then 16 bit Atari computers I owned since childhood to stay connected. I have become frustrated with the "internet connectivity" success.

I am currently using a 1040STF (no mods except TOS 1.4), with Link97 and EZFlyer 230, Hayes 56K modem (at 19.2K) -- I love every minute of it, exept the internet connection part. I have established connections, can get NEWSie to run OK, CAB to work but not usable, WENSuite to work and moderately usable -- I have come to the conclusion that the stock 1 MB just won't cut it.
So...

Do I: A) Upgrade to 2 or 2.5 MB for over $100 B) Upgrade to a Mega ST2/4 for $200-$300 C) Upgrade to a Falcon030 for $500 (see Falcon note below) D) Ever-disappointedly box it back up and by an Intel box, format the drive and run Linux or BeOS. I refuse to be a MS junkie.

I am leaning towards C or D.

I want:
A) Run the modem at full speed (56K)
B) See images when surfing
C) Multi-tasking (mail/browsing concurrently)
D) Use my existing EZFlyer drive

Concerns:
A) Can Falcon run my existing ST programs or do I need special versions?

Any thought or advice will be appreciated. Thx!
Wade
Its easier to get forgiveness than it is to get permission.

It seems to occur most commonly if you select 'read next item' (CTRL-A)
when the next item has already been deleted- the status of the next item
(which doesn't exist) is changed from 'D' to '?', and can't be changed
back again.

A useful feature would be for the actual file deletion to be deferred,
e.g. until you leave the current newsgroup, so tht you can change your
mind- it's very easy when skimming through a long index to overshoot,
and delete something which you realise an ohnosecond later you wanted to
look at. Changing a 'D' back to a '?' would then be appropriate.

3669. SQL on the Atari platform! Well, nearly...

Newsgroup: comp.sys.atari.st
Date: 1998-07-28 00:00:00 UTC
From: bhills@my-dejanews.com
Message-ID: <6pjtv3vsm1@nnrp1.dejanews.com>
Source record: 96343

Hi All,

I recently came across the Home Page of mSQL (Mini SQL) which is a cut down version of SQL but is still in accordance with the ANSI SQL specification.

I downloaded the source code to version one and decided to try and compile it on my Atari with MiNT (KGMD) and GCC to see if it would work.

The compilation and installation of mSQL went quite smoothly, although when the mSQL daemon was compiling the following four warning messages were displayed:

msqld.c 450: Warning: passing arg 3 `accept' from incompatible pointer type msqld.c 457: Warning: passing arg 3 `getsockname' from incompatible pointer type msqld.c 498: Warning: passing arg 3 `getpeername' from incompatible pointer type msqld.c 501: Warning: passing arg 3 `getsockname' from incompatible pointer type

Once the installation had finished I was able to start the mSQL daemon and use the admin tool to create a database. The only problem I am having now is that when you run the mSQL monitor (used to add, delete tables, perform queries etc) it exits back to the command line.

I added a few display statements in the daemon source code to try and figure out where it is going wrong. It seems that the monitor manages to connect to the daemon but then thinks that the connection has finished and so exits.

As I only know C at a basic level, I can only assume that it has something to do with those four warning messages as everything else seems to work correctly.

What I would like to know is if anybody else has tried to compile mSQL or any other form of SQL on their Atari, or may know enough C to fix the four lines of code that may be causing the problem.

It seems that we may be only four lines of code away from having a widely used database engine on the Atari platform, with enough tools to be able to incorporate database access into our own programs.

For any of you who want to give this a go, you can find the source code to versions one and two on the mSQL Home Page: http://www.hughes.com.au

Version two is much larger than version one, and failed during the system checking stage on my system.

mSQL can be a bit memory hungry during compilation and during its peak, looks as if it requires about 4MB of free memory.

Bye for now.

Regards,

Ben Hills.

I was soliciting input about the best "Atari route". THe intel box is a last resort. Besides I hate eggs! ;)

The Falcon route is looking pretty good right now. Does the Falcon require HD Driver to use with the SCSI-2 port if I want to use my EZFlyer as the HD?

> Problem is, I don't know what software I need to make use of my 1MB STFM on
> the 'net -- no doubt I need some sort of dial-up system, and a mass of
> stuff to set up *sigh*.

I just went through this with limited success. I used XCONTROL.ACC in order to load the needed STinG modules for STinG. Then once I established the connection I was able to use CAB 1.5 to browse the web. I was also successful in getting NEWSie .88 running to do email. An alternative that I got working too is WENSuite (but its not freeware or shareware).

The biggest problem I ran into is the 1MB memory. After everything is loaded (including HDDriver) there is barely enough memory to load a small editor for use with NEWSie. This same limitation effects the use of CAB. Only small pages can be loaded. I was able to load larger web pages with WENSuite but only up to about 35K (text only). The other major drawback is that you need Medium resolution so you might as well turn off the graphics anyway.

All the applications I am using/trying I have downloaded from various spots on the net. Search on ATARI at infoseek, the narrow the search to each peice of software you are looking for, or head to one of the many FTP sites.

Wade

3676. Newsie Suggestions

Newsgroup: comp.sys.atari.st
Date: 1998-07-29 00:00:00 UTC
From: ecncomr@socal.com
Message-ID: <6pls33$q3g@enews4.newsguy.com>
Source record: 96195

I have a couple of suggestions for future versions of NEWSie. I apologize if these have already been mentioned or implemented.

Would it be possible for NEWSie to automatically extract & DISPLAY MIME encoded e-mail messages? I get a lot of e-mail from friends that's in MIME format, and I get the little message that "your e-mail reader wouldn't be displaying this message if it understood MIME" (or something to that effect). Then you have to EXTRACT the MIME e-mail, which of course saves it as "FILE.EXT" etc. in the WORK directory. Then to actually READ the thing, you have to load that "FILE.EXT" into an editor. When most of my mails are like this, it becomes tiresome and annoying to take these extra steps to read them.

This leads to my second request. Is it possible to assign another separate directory for EXTRACTED files? Everything (including the kitchen sink) seems to go into the WORK directory - which gets very cluttered if you're extracting a bunch of PICs or MIME emails etc. How about the option to have NEWSie extract to one or more different directories (other than WORK)?

That's it for now.

Hi all,
I have an Atari 1040ST .
Does anyone out
there use music software with your 1040ST?

Is anyone selling music software for the 1040ST?

Also, the Falcon, can it run 1040 software?
Do they still make the Falcon? If so, who is it made by, and where can I get one?

All that are using Mastertracks Pro, or music software in general, with their 1040ST E-mail me please so we can compare experiences. I also have a few questions about it too!

Thanks to all!

In my case an imac would be the perfect upgrade. Yes it does include
PointCast. However, I was promised a new PowerBook G3 within six months.

> Besides, any new TOS machine that makes Sinclap nervous - to the

I guess the Atari 800 is not a Atari. I swore I used it everyday..

Hi,

>> Hi All,
>>
>> I recently came across the Home Page of mSQL (Mini SQL) which is a cut
>> down version of SQL but is still in accordance with the ANSI SQL
>> specification.

>What is it please ?

I presume you are asking what SQL is?

Basically, SQL (Structured Query Language) is a relational database
management system that provides you with a non-procedural language
for the manipulation of data within database tables.

I only know the basics of SQL, so if you want to find out more
about SQL, you could try reading one of the online reference books
at http://www.developer.com

Hope this helps. :-)

Regards,

Ben Hills.

hi elsa,

thereï¿½s a company in germany called C-LAB (located in hamburg) which is
still producing the falcon in a special version with better DACï¿½s than
the original and other improvements. also, the TOS is patched.
itï¿½s called FALCON MKX and dedicated especially to musicians.

i donï¿½t know if EVERY 1040-software will run on the falcon, but for sure
there is special software which uses the falcon hardware (f.e. the DSP)
and gives much more perfection than the 1040....

good luck, greets -micha-

You could also try those little pens that are made to fix car rear
window heating element. They have a special conductive ink that is made
for that sort of job. Try getting it from an auto parts store.

And don't start telling us there is no auto parts store around that spot
in the desert where you live ;-)

> there use music software with your 1040ST?

Yes. That is one of the applications the ST is still professionally used
for, and very good at.

>
> Is anyone selling music software for the 1040ST?

Yes. Cubase and Notator, which were the 2 best sequencers are no longer
supported, but you can still find old copies for sale from time to time.
There are a few small companies selling new software, mostly for the
Falcon, like SoftJee or Centek in France or Electronic Cow in the UK.

>
> Also, the Falcon, can it run 1040 software?

Most of it. Some games will not run, some will run, but only in
emulation. Most application software runs perfectly well on the Falcon.

> Do they still make the Falcon? If so, who is it made by, and where can I get
> one?

No, the falcon is no longer made. You can buy second hand machines
though. There is the new Milan, which is a TT clone that is being
lauched in Germany, but I'm not sure about it's music capabilities.

Cheers,
Nick

Are you sure ? That was true 5 years ago, but I don't know if they are
still making the Falcon. Anyway, there's no trace of C-Lab on the web.
Do they still exist ?

There was the MK-I (an Atari Falcon with the clock patch, audio patch,
and a stupid internal SCSI implementation) and the MK-X, which had a
rack case design and other improvements.

Cheers,
Nick

Hi john,- is it only ST users or does it include TT and Falcon users?

From a list I have made out of all the users in this NG and some BBS`s,
I have 2480 names. That only those who are on-line.

Do you think they all are on-line, or is it only some % of the community?
I think only some % is on-line, I know of 2 users, who are not using
anything,- BBS or the internet.

I remember reading somewhere, that ASH had sold more than 20.000 MagiC.
They didn`t say what kind of MagiC,- MagiCMac, -PC, or MagiC Atari.

cheers

Correctly. Except that you don't have to *format* them, just select
"partition", select the correct drive, select "TOS + DOS" in the
compatibility-dialog and press "OK". Partitioning takes about one
second on my Zip.

I have never formatted Zips, but it might be wise to scan them before
partitioning if they're old and heavily used.

Btw. you can also use IBM-formatted/partitioned Zips right out of the
box if you have either of the following configurations:

o MiNT 1.15 release version and HD-Driver >= 7.55. MiNT 1.15 isn't
really released yet, but it will be very shortly. This version also
supports FAT32-partitions so you can use really, really big
partitions if you want.
o MagiC (not sure what version, but from v.5 IIRC) and HD-Driver. I
don't use MagiC, but if you do you should check the manual.

But I prefer the "TOS + DOS"-option, as it allows me to read the disks
on any Atari with the correct version of HD-Driver.

Add to the list the many thousands of musicians worldwide who still use Ataris for MIDI on a budget ... I think worldwide the user base would be a high FIVE figure number, maybe even just into SIX figures ... It would be very interesting to know for sure

Atari Portfolio for sale, in excellent condition. I havn't used it very much (that is why I want to get rid of it). Beware: it has a German keyboard (QWERTZ). Including English manual.

Also I offer a Portfolio Modem Interface. I think it works at 9600 Baud. It is perfect for reading your e-mail (if your provider has ascii access, that is). Including Hermes software (terminal software i recall) and videotex software, but no manual.

I'll sell together for fl.100,- = £30,- = $50,- = DM90,- (exluding shipping costs etc.)

If you are interested, send me a mail.

Yup. Make sure the track is scraped clean (and alcohol wiped) for a
couple of millimetres either side of the break. Be careful with the
silver paint - any old stuff won't do. Make sure it says 'conductive'.
The cheapest is often from auto repair shops who sell stuff to fix the
breaks on de-mister tracks.

I can understand that. Some wonderful people have come forward to submit articles but the next issue of ST Informer is about 90% written by me. Not good for my sanity or the readers ;-).

>I would tend to prefer a "FAQ" like entity, a "standard reference
>work" that could grow as people (such as those with something
>to sell!) contributed descriptions of programs.

This is a really good idea. I remember the catalogs for PD software from BRE that had fairly long descriptions for most titles. The same thing for commercial programs would be helpful. Would anyone be interested in submitting reviews of old programs? Conceivably, this project could grow to be of fairly immense proportions. Even then, you may not find the software you want.

You have a good point that it only helps you at that one point. Again, though, a database of short reviews for nearly all popular older ST software would be huge. I'm more than willing to store such a list, though, and even work towards having a searchable database on the Web for it. This would take a lot of my time, though, so I'm not making any promises ;-). I am keeping all ST Informer articles on file, of course, for later use. I'll put an index of past web issues online in the future.

As there is '0' HP-II drivers in Print master Plus, that's one
program that doesn't have it.

#Hello,
#
#I own the fully functional commercial version of CAB 2.5 and the
#manual states that printing requires NVDI 3/4 or later, or GDOS.

I have CAB 1.5 and a demo of 2.7 (the new release I think) Now while
1.5 will print using my setup of NVDI 4 it is crap, all wrongly
formatted and squashed up, however the demo of 2.7 is perfect, just
looks like it does on screen, apart from the image quality that is :\
I had lots of trouble with GDOS as well and was glad to see the back
of it when I replaced it with NVDI, a very worth while investment in
my opinion if only for the Vector Font support.

Cheers

Hi !!

I am looking for the object file formats for the different compilers on
the ATARI computers.
In particular, I am interested in the formats of
PureC, PurePascal - containing the debugging info stored in the object
file. Is there any Profiling info stored in the
object file, so that PureProfiler can work with ??
MegaMaxModula 2 - for the definition modules and the implementation
modules, also containing debug info, if applicable.
GNU C/C++/ObjC - Also need "full details" about the object files.

Any other object file formats are also greatly appreciated.
I am currently writing kind of a ReAssembler, so I need to know anything
that is available about all the object file formats available on the
ATARIs. Is the *.LOD file's format for the Falcon DSP modules anywhere
documented, or do I have to ReAssemble the Falcon ROMs to get the info I
need about ?

>
>Wade

No, HD Driver is not required on the Falcon to use EZFlyer unless you
are wanting to software write protect your disks. I use the
Syquest 44, 135, 230 (EZFlyer) and 1.5G drives on my falcons with
ICD scsi pro software (6.5.5) and they work fine (no problems
formatting, partitioning, reading or writing to the drives and
the ICD software recognizes media changes). With the 1.5G
drives I get 12ms access - that's as good as my fixed harddisk.

I haven't tried AHDI with the removables. Wayne

3705. Tests with 68881

Newsgroup: comp.sys.atari.st
Date: 1998-07-29 00:00:00 UTC
From: ddc@imaginet.fr
Message-ID: <6pnl4t$q5s$1@news.imaginet.fr>
Source record: 96224

Hello to all,

The floating librairies of Pure C can take advantage automatically of a 68881 in peripheral mode, in a Mega or Mega STE. However, these librairies are not compatible with the 68882: it makes the program hang. While there are several patches available, it can be tedious to repatch the program each time you change version, and some time this is not even possible (for instance if the program is on a CD).

A programmer is working on new optimised floating libraries for Pure C, which will work at the same time with a 68881 and a 68882. Thus, the programs produced will work on any 68000 machines, without requiring patching.

I am doing the tests with the 68882, and it works. Now, we need the help of the owner of a 68881 equiped machine, to verify the librairies still work with this copro. Mega STE prefered, but results could be also interesting on a Mega ST. Tests are really simple and straightforward. Just launch 3 .TOS, and write the results.

Any person interested should contact me by email.

Thanks in advance for your help,

>Oh well...

Win95 will put in an extra directory entry with dodgy set flags even if
the name only has 8+3. To be safe you should stick to DOS when copying.

I have also found that my pc writes something to the boot sector if I
insert a Atari DD floppy. It also does this when _reading_ the disk!.

Conclusions are that you should always keep Atari floppys write
protected when inserted in a Win95 pc. For copying purposes use a
dedicated floppy and check it with Scandisk (pc) if you have deleted any
files with the Atari because the extra directory entry is still there.
There are also some problems with nested folders so it's safest to put
all files at the root (A:\).

>I guess the moral of the story is to stay away from anything infected
>with the likes of bull gator and mis micro$not zoo ;-)

When dealing whith floppies this is actually very true!

>Yes, I know and have a working setup with STiNG, but found it far from
>satisfactory, at least on my STe (4Mb, MagiC, NVDI, 28.8K modem....).
>It's just too slooooowwwww!

>a few bugs) I've probably sent all my mail AND news messages and am well
>on my way to completing the download of all my new incoming
>mail/news messages using terminal emulation and SOUP offline packets!

ppp will always be slower because the soup packets are zip compressed
and downloaded with z-modem. the mnp compression in the modem will only
partly compensate this.

On my Mega STe setup with 28800 modem at 57600 I get around 3500 cps for
single (long) mails and news articles. The average throughput with
Newswatch is around 1300-1500 cps because all posts are fetched
separatly. In soup mode (wich I have not tested) I would expect around
3000 cps raised by a factor of three because of the .zip format

resulting in 9000 cps!

I could start off the "guide to ST commercial software" effort, with your help. Here's Bravo Sierra's ST S/W line. If you have any of these, send me (email) a description of what it is, maybe an idea of how good it is (review; yes, subjective), maybe a list of what the complete set should contain (so a prospective buyer could ask/know if he was getting everything). Maybe other stuff, like "needs x hardware/software", other versions and what the differences are, TOS dependencies, monitor, etc.

Note: Entry for Falcon v.1.0 looks like it has a pretty good entry. How about that as the model?

3708. FS: Atari ST, Colour monitor, ICD SCSI Host Adapter

Date: 1998-07-29 00:00:00 UTC
From: Owen Lawrence <owen@iosphere.net>
Message-ID: <01bdbb28$21a9bd20$2a3332cc@puker>
Source record: 96227
Cross-posted to: comp.sys.atari.st,ott.forsale.other

Atari ST, with OS upgraded to TOS 1.4
ICD SCSI host adapter, with cable, allowed me to connect a SCSI hard drive
(Also 85MB SCSI hard drive, loaded with errors, but it's in a separate
old IBM case and power supply which would work if you wanted to put in a
later model drive, but it's probably not worth your while to have it
shipped).
Colour monitor
Laser C compiler
Some books on ST internals
Whatever other software or accessories I can dig up

I kept this computer because I was using it to record and playback music on
the church's digital piano. I've moved, and am no longer using it.

I'll accept the best offer, + shipping, if necessary. Call or e-mail for
more details if you with. Thanks.

The other way to sort this problem out is to put a twist in the drive cable.
This is how I did it. I've tried to make this as plain as possible, so as to
reduce any misunderstandings to a minimum.

1. Disassemble the connector at the drive end of the cable. Take great care
not to break the clips at the edges of the connector. I did this and had to
buy a replacement.

2. Carefully split the ribbon cable to a distance of about 2-3 cm (1 inch)
from the now bare end of the ribbon cable, between wires 9 and 10, doing
the same between wires 12 and 13. You should then have one length of 34
core cable that at about 2.5 cm from the end becomes 9 core, 3 core and

22 core ribbon.

3. Place the 9 core ribbon (with pin one/red strip) back onto the connector in the same end it came off of. Pin one on the connector is often marked with a triangle.

4. Repeat this for the 22 core ribbon.

5. Carefully twist the 3 core so the wires 10 and 12 swap places and press this onto the connector in the gap.

6. Reassemble to connector, taking care not to break the grips.

7. Plug the connector into drive and boot.

The reason for this is most new drives are configured as drive 1 (B:) so, while the Falcon, or other Atari, sends the signal to select A: (drive 0) the drive receives this and ignores it, since it will only respond to a drive 1 select.

What this twist does is to swap the drive 1 and drive 0 select lines so the Atari selects drive 0 (A:) while the drive receives it as a drive 1 select, which is what it wants. The result of which is the Atari recognizes, and uses, the drive.

I can't see any way of making the driver that I use (the HP660C) to be the default, every time I run a prog and go to the "Settings" dialogue that WDialog adds, it's the Epson printer at the top of the list.

No doubt everything is better integrated with NVDI 5, I'd like to think so.

I have an Atari 1040 STE in perfect working order except the disk drive
which fails to respond. It is boxed as new with all manuals and
education/start up disks instructions and there are a couple of games.
Im selling it for ?30 UK pounds plus postage and packaging
Anyone interested reply to me loonie@globalnet.co.uk

i use cab2.5 nvdi4 and an epson stylus

i don't do a great deal of printing ,but in the past never found a good spooler
i have a prg fred west in the auto folder and know i've seen fprn somewhere
but probably in some disk box i've not been in for an age

the problem seems to be more how long cab thinks about it berore doing anything
at all,and hogs the whole system while thinking and printing

Not quite! MM is running emulatED it, is not the emulatOR.

I am pretty sure that you can't. To be fair you are running 2 OSs at
the same time on a single machine, that in itself is impressive.

> By the way, having tried the demo on a 68LC040 powered Mac I was blown

I never got around to installing the Internet stuff apart from KA9Q
which is text based so I really don't know. I'm sure in speed terms it
beats Navigator, it couldn't do much worse.

Not directly, but other users tell me that you can use Semper to handle the other ports at higher speeds, then "hand off" to BBS Express. I've not tried this myself (yet), as I'm still using a Mega ST with a stock serial port. I plan on upgrading soon, and trying it for myself. Semper has a Web site, do a search. Good luck! ;-)

I have not updated for over a year now, but the last one I saw
was able to use up to the 38.8 I think. I'm not sure if you
could use any port other than #1. It's been awhile since I
checked it out.

What y2k bug in pgp263? I've tried it and found no y2k bug in it.

> is there some program to fool the tt into using a 4-digits date ?

Is there a difference between how the TT and ST handle dates? If not, why
are you having date problems after 2000 on a TT, whereas I'm not with an ST?

I just installed GENEVA and NEODESK. When it is loaded CAB doesn't resolve URLs. If I reboot without GENEVA the CAB works okay like it always has. I have tried re-ordering the AUTO folder but still can't get it to work.

Just for grins I tried loading up my old STIK setup and it works under GENEVA just fine. (Or at least as good as it always did! SMILE!)

Is anyone aware of any conflicts with STING & GENEVA?

One thing that I was wondering if it was normal is that the msgs for DRIVIN & SCC both come out before the GENEVA / NEODESK msgs. Does GENEVA do a double boot?

Any suggestions would be greatly appreciated!

>How can i connect an ide hard-disk with an atari 1040 STE?

You would need to buy a kit from TUS Developments UK.

The interface is 59UKP. You can buy a 2.5" IDE as an addition - as an example - interface+160Mb drive is 109UKP.

You should really think of going to SCSI as this method is far more flexible.

Yes, I loved flight simming on the ST platform. I started with F15 Strike Eagle. Then my passion stretched out to F15 SE 2, Flight of the Intruder, Dogfight, F19 Stealth Fighter, Knights of the Sky, A320 Airbus, and probably others that I can't remember.

About the flight-sim newsgroups -- you might be surprised just how many people started on the ST if you asked on comp.sys.ibm.pc.games.flight-sim...

However I moved from the Atari several years ago to what many of you people hate -- the M$ platform. I have to say though, that playing F22 ADF by DID in a resolution of 800 X 600 in 65535 colours at 30 frames per second is worth it! EF2000 is also incredible, as well as Flight Unlimited (1024 X 768 resolution in a GAME anyone?) and Flying Corps.

Then there's the multiplayer experience -- playing Warbirds with 100 other HUMANS on-line is just mind-blowing! As is a good head-to-head battle in EF2000 of F22 ADF. And note, none of those programs in by M$ (though I suppose Win95 is...)

Still, I'm always going to remember the Atari as my starting point, so if you want to talk about Atari flight sims, head along to the ibm place -- I know the people there a bit, and they won't mind -- as there's no such Atari NG...you may even find many of them played on the Atari in the past ;)

: One thing that I was wondering if it was normal is that the msgs for
: DRIVIN & SCC both come out before the GENEVA / NEODESK msgs. Does GENEVA
: do a double boot?

Unlike Magic, Geneva does not do a double boot. It is normal to see the
Autofolder program's messages before the Geneva and Newodesk startup
"shields." There is an autofolder program called "Neoload" that will
print a line of text to screen, as most autfolder programs do, that will
have loaded earlier. As it is best to have DRIVIN and SCC as late in the
outfolder as possible, and NEOLOAD doesn't much care where it goes, it is
probably best to arrange things so you see NEOLOAD, then DRIVIN and SCC,
then the Geneva and Neodesk "shields." You can do this by using Neodesks
"reorder items" option to reorder the contents of your "Auto" folder so
NEOLOAD comes beforee DRIVIN.

3738. StartMeUp!

Newsgroup: comp.sys.atari.st
Date: 1998-07-30 00:00:00 UTC
From: ecncomr@socal.com
Message-ID: <6pqnmq$alh@enews2.newsguy.com>
Source record: 96057

Anyone here gotten StartMeUp! to work?

I just got MagiC 5 installed and working on my Falcon and wanted to try StartMeUp! since I don't have an alternate desktop yet (and Magicdesk is pretty lacking I must say - I'm very underwhelmed to say the least) I want a better way to launch programs. But I can't seem to get SMU to even load.

First, I kept getting these messages that the START.SET file was "corrupted". Basically all the settings need to be customized / altered. But a lot of the programs and files it refers to I don't even think I have - and I haven't really gotten familiar with all the extra little programs and files MagiC creates / uses yet. So, I commented out all the lines that were causing it trouble, then tried to run it again, and got this dialog:

"StartMeUp! requires XMEN_MGR. Please copy it to your MagiC-APPS folder"

Well, I found XMEN_MGR, but there is no "MagiC-APPS" folder. Nor anything resembling that. I tried creating one, I tried putting XMEN_MGR just about every directory I could think of, but SMU won't go any further.

Anyone have any suggestions?

This is a terribly un-userfriendly program to set up! Configure this, re-type every line in this TXT file twice, copy these 47 files here there and everywhere in between, Use ficticious folders and directories, and when you're done, do it all again because we (the programmers) seem to think people actually ENJOY this kind of activity. Sheesh! How about a simple instalation program? It _is_ 1998, right?

I seem to remember trying them a long time ago. Are there English versions?
And the things I like about Selectric are that you can easily
move/copy/delete files from the file selector, as well as other cool things.
Are these (seemingly obvious) features in Freedom / Boxkite?

I remember checking out the program a while back, and I was in 256 color
mode, but when I loaded the program, everything looked like it was in ST
HIGH. I didn't see any color anywhere on the screens / dialogs. It looked
very plain and 1989-ish. Maybe it was an old version or something...

3741. POPGEM 1.2 oups?

Newsgroup: comp.sys.atari.st
Date: 1998-07-30 00:00:00 UTC
From: Katherine L Ellis <kellis@primenet.com>
Message-ID: <Pine.BSI.3.96.980730183030.359A-100000@usr05.primenet.com>
Source record: 96060

Oh sorry I thought the description on my page and the message about
POPGEm 1.1 earlier was enough. Obviously not.
Lemme just paste the readme file then:

README file:

POPGEM follows the POP protocol as defined in the RFC 1225.
Demon.UK might have problem as I heard they don't follow it.
I did try with demon.nl and worked perfectly.

What you need is: STIK/STING or GLUESTIK.
At least 260 Kb of free RAM for POPGEM.
A multitasking OS. (MiNT/Naes best)
An AVSERVER setup and running. (THING for example)
With files *.TXT and *.HTM assigned. (1stguide and CAB for example)

In the stik configuration file, you should have 3 variables set.

POP_HOST=pop3.primenet.com (for example)
POP_USERNAME=joey (for example)
POP_PASSWORD=my_passwd3 (for example)

In sting, it is in default.cfg that you will place those
POPGEM is a shareware. Should work in MagiC but can't guarante it.
The RSC file is handled by the AES only. It has been made to look good in
Multitos/Naes 16 colors. If it looks crappy in Magic.
well not my fault really.
**** Please, Magic users ****
DO NOT erase the file popge2.rsc
POPGEM will load this one if Magic
is found to be your OS.
****
Some extra popups are used when the AES provides them (form_popup()
Magic/naes compatible only.)
For others, doubleclick on VIEW to get the HTML export. And LEFT
mouse click for TXT export.

RIGHT mouse click over an object will call BubbleGEM and display the
appropriate help. BubbleGEM needs to be installed and laoded for it to
work of course.

The folder "mailbox" should always be existing for POPGEM to work fine.
The installation so far is not possible on MINIX partition. SO for this
BETA version just install POPGEM on a FAT partition. (will change).
*****
POPGEM 1.2 has few extra. counter for email marked as deleted. Email
marked as DELETED will be ERASED from your POP server when you Disconnect.

*****
There is also an extra icon (a PIN icon), that acts like a pin :)
YOu can actually drag and drop this PIN wherever you want on your desktop,
other applications, trashcan etc :)

The Main window of POPGEM doesn't need to be topped to work in background.
(i.e you can click, select directly, even if untoped).

The file uudecode.ttp present in your mailbox folder only has been
tested under MiNT, I don't know if it will work in singletos/magic.
To use it, Just drag and drop the email that is uuencoded on to
uudecode.ttp and that's it.
Same for munpack.ttp. Drag and Drop the MIME encoded email on it.
The file icons.rsc contains like 5 color icons, so you can assign
popgem.prg in your desktop.

The little blue triangle in the big black box is to remove the gadgets of
the window.

If you click on the black-info-box, it will reset the default message in
it. Just cleans the box out.

Shortcut added the DELETE key, will Mark/unMark as deleted.

POPGEM can run as an ACC.

POPGEM 1.2 supports sounds event.
POPGEM will rely on the AVSERVER to play *.wav files. So you need to have
*.wav assigned to a player. Most preferably, a player that will NOT lock
the AES!
GEMjing, backgrplay recommended. Actually ANY player that supports *.wav
files, AV-protokol, and that will NOT lock the AES. (example don't choose
PHplayer so far. It does lock here, I hope this will change).

What you need only, a folder "sounds" with specific sounds filename.wav

If the folder sounds has not been found, POPGEM will bypass all sound
commands.

If a sample is missing, Example: fetch.wav well, all the sounds found
will play except when fetching email.
Here is the list of sample supported by POPGEM:

connect.wav (when first clicked on connect server)
connect2.wav (If your mailbox is not empty this sound will play)
markdele.wav (when email mark as deleted)
unmark.wav (when you made a mistake and you want the mail UNMARKED)
pin.wav (the drag and drop of PIN icon)
click.wav (the click on right or left arrows)
credit.wav (the INFO credit button)
fetch.wav (Fetch headers icons)
filesel.wav (when saving, the fileselector opens)

Just file-rename the sounds you don't want, or directly the folder sounds\
if you don't want any sound.

**** SHAREWARE ****

> Modern PC's have a lot of difficulties reading single sided disks,
> whatever you do.

There's a freeware program from 1987 called Doubler, whose readme starts
off with this:

This program takes single sided disks and formats the
other side of the disk, making it a double sided disk,
without damaging any of the data on the disk.

Wouldn't this be the best solution, assuming she still has her ST to run
the Doubler program?

Well yes the Atari CAN surf the web!

You need firstly a TCP/IP stack. There are three major ones around:
Stik, Sting, and PPP Connect. The first two are the most used, and
have the most client programs around for them. I personally use Sting
which is a development from Stik, and supports both SLIP and PPP
protocols. Stik and Sting are freeware, but PPP Connect is commercial
and comes with the Cab Web Browser.

Having mentioned that, Cab is the major web browser thats around, but
there are a couple of others in development, but they don't really
have much user base yet. Cab has been commercial since v2, but
previous versions are shareware, and are usable on the Net.

Email clients, well the major ones are Newsie (which also deals with
Newsgroups and FTP) and Antmail. Both are shareware.

There are lots of other clients around for Stik and Sting, such as
Telnet and IRC etc, and all are available online on BBSes or the Net.

I can report that having used both the ST and the Falcon on the web,
obviously the Falcon is the best machine to use, with its high-colour
modes, but the ST is still usable, if a lot slower (it has to dither
most web-graphics into usable form, which takes a lot of time).

Currently none of the browsers have Java which is used quite a lot,
nor is there support for Real Audio, but I wouldn't be surprised if
someone is working on these deficiencies.

Well, the reasoning behind this is that NVDI versions older than v3 do
not have scalable fonts, which the Web uses. Get a later version,
you'll find its worth the extra, for the speed and the better fonts.

That's correct. I was getting a lot of delays resolving hosts when I
was using a dynamic DNS, so I'm now using static primary and
secondary DNS numbers.

It's a reader. Why does it need color screens? In any case, that's
not the same as saying "mono only," which suggests it only works in
monochrome.

You can have color around your windows, if you want, by using
WCOLORS.CPX.

I am using STing. My ISP uses PPP with PAP. It dynamically assigns
the IP addresses as well as the DNS. I have the modem set at 115k,
and the init string is set at the default AT & F0 which is the factory
default 33k, compression on, hardware flow control. I reinstalled the
HSmodem drivers with their default settings. Transfer speeds with CAB
seem to have leveled, but it still is kinda slow.

Thanxs

Well, I'm not about to speak for the author but, yes & no. Yes -
provided you want to open a 'can or worms'.

>I get a lot of e-mail from friends that's in MIME
>format,

Tell them not to. This is a Mickysoft thing and although enabled by
default, it is very easy for them to turn off at their end. See below.

>and I get the little message that "your e-mail reader wouldn't be
>displaying this message if it understood MIME" (or something to that effect).

More psychological stuff from M$ and friends - "use our software, use
our software". What that little message should contain is this
mouthful: ;-)

[mouthful on]

As you can see this message, and none of what the sender typed, it
means you are using an email client which does not break any rules.
The email client that sent this breaks them all. It has most likely
encoded a whole web page (but it might not have done) plus graphics
(but it might not have done), sounds (or perhaps not) and silly fonts
(or maybe not) which are highly likely to *not* exist on your machine
(or maybe they do), or any machine except the sender's. We suggest you
bounce this huge download back to the sender. However, if you insist
on viewing it then you will need the following ...

a)
600x800 truecolour screen, or greater if that was what the sender was
using because they probably didn't think about your screen.

b)
A web browser capable of interpreting our wierd html dialect once the
Mime is decoded - or maybe not - the sender's email software may be so
stupid it wraps up plain text as Mime. Who knows? Best to install lots
of other software to cater for all the combinations just in case.

c)
Lots of free (and not so free) plugins which we graciously don't make

available for your machine.

d)
A graphical html editor so that you can get your own back and return a
load of bandwidth wasting junk back to the sender.

[mouthful off]

> Then you have to EXTRACT the MIME e-mail, which of course saves it as
> "FILE.EXT" etc. in the WORK directory. Then to actually READ the thing, you
> have to load that "FILE.EXT" into an editor. When most of my mails are like
> this, it becomes tiresome and annoying to take these extra steps to read
> them.

Most likely they are using Outlook Express. If they are, cut the next
paragraph out and send to to them ...

Sending me plain text:
Open the "Address Book", click on my address, then the "Personal" tab,
then near the bottom, enable the checkmark that says "Send E-Mail
using plain text only".

That should solve your problem. <G>

Hardware-

ALL hardware is in good to excellent 'used' condition and pre-tested before shipping.

1040STf's-(still going strong!)1meg-used/tested.....$50ea.
Includes Atari Mouse or Marconi/Marcus 3 button track ball, your choice.

Atari SC1435's -14" stereo RGB monitor, headphone-jack, video cable, used/tested...$65ea.

Atari SC1224 12" Color Monitor - used/tested..$40.

Atari System: 1040STf + SC1435 + Atari Mouse or Marconi Track Ball-all items used/tested.......$100.

Atari PCM124 12" Monitors-New-$20 ea. Original box and manual.
Believe these were used on 286 type computers and Atari's short lived PC. Two units available. 7-Pin video cable.

** LYNX STUFF: **

LYNX II -used but works great except the external speakers do not work. Need headphones to hear audio. $20

LYNX Kit Case-Carry Case-NEW
12"wide 9 1/4" tall 4 1/4" deep-$12

LYNX AC Adapter- New -120V 60Hz-$8

LYNX battery pack-holds 6 'D' Cells-excellent shape.-$8

LYNX NAXI Power Pack-rechargeable, includes A/C charging unit.
Used but ni-cad batteries are in good shape, still hold a good charge. Asking $10.
LYNX Sunshield- $5

*** LYNX GAMES ***
Used but like new
All games have original box and instructions except O.E.M. games listed:

Baseball Heroes...$10
BattleZone 2000...$12

BlockOut.....$10
Blue Lightening.....$15
Hockey.....$10
Joust.....$12
Shanghi.....$12
Steel Talons.....$10
Super Asteroids/Missle Command...$15
Toki.....$10
Warbirds.....$20

O.E.M. Games - full instuctions/no box

Batman Returns...$8
Hard Drivin.....$8
Shadow of the Beast...$8
S.T.U.N. Runner...$8

ST Software: all games are in the box with manuals

Hardball-Accolade-baseball sim-$5
ST Pool-Shelbourne-rack 'em up-$5
Map & Legends-The Cartographer + Data Mao Collection- $10
Gold Rush-Sierra-adventure sim-$5
Flight Simulator II-Sublogic-with Scenery Disk #7-$10
RISK-Virgin-Word conquest game-$5
Their Finest Hour-Lucus Films-The Battle Of Britain-air combat sim-$5
SCRABBLE-Leisure Genius-crossword game-$5
EZ Test Writer-$5
DragonScape-adventure game-$5
Metro Cross-Epyx-scrolling skateboard game-$5
Data Diet-Disk compression program-$5
StarGlider-Firebird-3D combat-air to air/air to ground sim-$5
Final Assault-EPYX-mountain climbing adventure-$5
Transputor-cool 3D marble action game-$5
LED Storm-Road race with lazers-$5
Crash Garrett-1938 adventure game in FRENCH-$5
Championship Wrestling-Epyx-Wrestling Mania for the ST-$5
Phantasm-space shoot-em up-$5
Project Neptune-Epyx-James Bond type adventure-$5
Renegade-Taito-street fighting-cool game-$5
Prime Time-make your own TV shows-$5

Following-no box OR doc's

Warship-Stratigic Simulatons-$2
Read & Rhyme-Unicorn-$2
Math Wizard-Unicorn-$2
The American Pastime Baseball Simulator v3.01-$2

That's All For Now.....
Buyer pays Shipping.
Payment: Check/M.O. or COD, your choice.

It's not a magnet but a ferrite ring - the wire is wrapped round it to make
a coil, it's meant to stop external high frequency interference.

I'm not sure that fitting one would cure this problem tho'.

Hi, new version of POPGEM. MANY improvements, MANY bug fixes. and
takes full advantage of the av-server, BubbleGEM supported, sound
event(9 of them, that you can disable if you wish), the av-server
will forward the *.wav to teh correct player. GEMjing or bkgrnply is a
good choice. Drag and Drop this "PIN" icon.
STING/STIK/GLUESTIK compatible, MULITASKING OS needed, decent
av-server desktop. (NOT magxdesk for example).
Bye.

Well, in addition to being very amusing (and true!), your message offered
some good advice. Thanks for your input!

Minor complaint:

Isn't Okami MONOchrome only?

I know that's not at all related to it's functionality, but I don't know if I'd call that the "best solution for Atari" (ST/STE maybe, but a Falcon?)

Modern PC's have a lot of difficulties reading single sided disks,
whatever you do.

If you still have the ST, you can try a cable connection with ghostlink
to transfer the files.

You can try using an ST emulator on you PC (look for pacifist or tosbox)
and a program that makes disk image files (makedisk). You could then use
the emulator to read the disk image file and tranfer it to your HD, but
I doubt even this will work.

The easiest way would be to ask someone around here to read the disks
using a real Atari and to copy the files over to double sided or HD
disks. Try finding someone in your area.

This is all in the Quick FAQ.

Cheers,
Nick

Hi,
First how do you survive using single sided disks?, I assume you are using
them because you have a single sided drive. As most software now comes on
double sided disks I would recommend getting a double sided disk drive.
It is very easy to copy the files from the Atari to a PC. (I am assuming
that
you are using a newish MD DOS machine with Windows, if not does your PC
software allow you the option of formatting a 1.44mb disk to 720K?, if so
then you can proceed).
Windows (3.1 not sure about later versions) will allow you to format a disk
to 720K (Atari double sided) which
the Atari can then use as it can deal with MS DOS formated disks (If you
don't have access to a double sided drive the ST should still be able to use
the double sided disk provided you don't need to read any files that are
palced in whole or in part on side two by the PC.) .
Now all you have to do is copy you wordprocessed file onto the disk and from
their to your PC.
Note that your files will probably need to be saved (or re-saved) in ASCII
format otherwise you PC wordprocessor will not read them.

You could try making a single sided copy of one of the disks and try to
copy from it directly but I assume that you have already tried this.
I hope this helps,
Stephen Moss.

P.S.
This should have reached you sooner but for somereason when I tried mailing
it to you direct it was
returned,

Hi Derryck,

well, I've been using Thing ever since the early versions. No other desktop could match that... till I got the demo for Jinnee back in '97 and instantly fell for it... I did a (p)review for a dutch ST magazine.
In short, it's a lot like Thing. It supported 256 color icons, whereas Thing *then* only supported 16 color icons.
The main difference is "Looks". Everything can be set up in different colors for certain types of files, backgrounds in windows are more customizable (that a good word?), and one major advantage is when dragging files to folders, those folders are springload-opened (time in which this happens is all selectable, whereas Thing *now* is able to do it in a fixed time). It means especially that feature works far better in Jinnee.
You can assign different fonts to your Titles, contents, notes, whatever on your desktop.
Contents of folders can be displayed together with the root files (only with "display in text"). Icons' labels can have any color or be transparent (THIS looks good, and ain't it 1998?)
The "notes on your desktop feature" works great, especially with Internet addresses.
For installed apps you can choose TXT for a viewer, wordprocessor, whatever. When clicking such a file you'll get a pop-up where you make the choice. Thing only links to the first assigned application.
Trashcan can also be a "recycle-can", no such feature yet in Thing.
Certain drives can be set to prevent delete operations, kinda handy when using drives for B/U purposes only.
Otherwise it's a lot like Thing and the only reason I haven't bought it is the lack of an English RSC file... OK, I'm not that bad in German but I hate to see those Jerrywords like "Reichseisenbahnueberquerungshinundherschieber" on my monitor :-)))
In fact I borrowed several Jinnee-icons and stuffed them into my Thing RSC files...

Choices are always personal, but I consider Jinnee as the "Ultimate Desktop", at least very near to it... OK, this goes especially when you can run at least 256 colors or higher modes, but again, it's 1998 now :-)

So all that "magnet" does is stop other electronics form interfereing
with the F030, not the Falcon from causing interference. The Falcon
is putting out some type of frequency that it should not be. I think
the problem may be a "herringbone pattern". It's kinda silly for a
machine to have RF output and to cause RF interference. I tried the
grounding thing someone suggested but still the same problem.

You can get a double sided drive for the ST, they are very cheap, and
very easy to install.

You could connect the two computers together with a null modem cable.

You could zip up the disks, and E-Mail them to yourself:')

What about Freedom? I've had nothing but trouble with Freedom 2, but
Freedom 1.15 has worked perfectly under N.AES, Geneva, MagiC and
MultiTOS for two years now.

Or the latest version of Boxkite? It's non-modal and handles long
filenames just as well as Freedom.

It seems to me, that it`s not a problem on your side. Most other servers
do this from time to time,- even with a ISDN connection. It all depends
on how overloaded the line/server is, at that moment.

If you normally get a god connection, and only occasionally have this
kind of slow transferre, your in the same possition as I am here.
Every night, from around 7 pm until 11 pm all ISP`s her in Denmark is
slow, that goes for the ISDN connection to. After midnight the speed goes
drastically up, from around the same as you get, 100 - 150 cps up to
around 3000 cps and sometime more.

cheers

>i don't do a great deal of printing ,but in the past never found a good spooler

Have you tried using the NVDI spooler? You just stick:

SPOOLPATH = C:\GEMSYS\SPOOL\ (whatever folder you want).

into NVDI.INF and set up the folder it points at.

>the problem seems to be more how long cab thinks about it berore doing anything
>at all,and hogs the whole system while thinking and printing

Mmmm ... all this vector font stuff takes some time anyway, perhaps
this is the best you can get. It all depends where (if at all) the
bottleneck is occuring.

Could be in the printer itself. Does the Stylus have a RAM print
buffer? Is it enabled? It will not ask for more data until the current
buffer is empty.

A print spooler will allow CAB to get on with the job and finish
without waiting for the printer.

I don't have a lot of bother with CAB (TT, Magic, Canon BJ300) but I
don't print much from it anyway.

From what I remember I had to wait about an hour for an A4 360x360 dpi
image to be printed by Imagecopy.

```
: The other way to sort this problem out is to put a twist in the drive cable.
: This is how I did it. I've tried to make this as plain as possible, so as to
: reduce any misunderstandings to a minimum.

And even easier way of doing it is to get a standard PC floppy drive
ribbon cable. They come with one un-twisted connector and one already
pre-twisted. They're inexpensive, and it shouldn't be too much trouble to
find one with only one (or no) useless 5 1/4" floppy connector.

Atari ST, with OS upgraded to TOS 1.4
ICD SCSI host adapter, with cable, allowed me to connect a SCSI hard drive
(Also 85MB SCSI hard drive, loaded with errors, but it's in a separate
old IBM case and power supply which would work if you wanted to put in a
later model drive, but it's probably not worth your while to have it
shipped).
Colour monitor
Laser C compiler
Some books on ST internals
Whatever other software or accessories I can dig up

I kept this computer because I was using it to record and playback music on
the church's digital piano. I've moved, and am no longer using it.

I'll accept the best offer, + shipping, if necessary. Call or e-mail for
more details if you with. Thanks.

Fayolle a ï¿½crit:
>
> How can i connect an ide hard-disk with an atari 1040 STE?

You need an internal IDE board from The Upgrade Shop in the UK. This
card has several restrictions though:

- STE only
- 68K processor must be socketed (some of the first ones were soldered)
- It plugs onto the 68K, so no other board can be fitted at the same
time.
- It is designed for internal mounting of a 2.5" IDE drive. You can fit
a 3.5" one, but you will need to put the STE into a tower case with a
more powerful power supply.

I have one of these cards. It works great, but took quite a while to get
it shipped from the UK.

Cheers,
Nick

Euch, can you tell me then why I can use Okami in 256 color mode. It even runs in truecolor mode. I had it running with a ET6000 PCI graphic card. A friend of mine has it running with ET4000 and now with a Nova plus 2 card.

Why don't you try iPRN2? It's some kind of print accelerator that really
speeds up the whole printing business.
A demoversion is delivered with the NVDI distribution disk.
It's also somewhere on the web. Cyberstrider do the registration.

>fee for Thing! will be cheaper than a purchase of Jinnee.
>

A few month ago I bought me Jinnee but to be honest I don't use it
very much. The mean reason for that is that Jinnee doesn't support the
MiNT file system. With other words you can't launch MiNT executables if
the exec doesn't have an extension which means one has to add .ttp on
every exec one like to use.

Furthermore on non-MagiC systems one need to use that dreadful
prog called *wdialog*.
Also on my system I found that Jinnee doesn't like truecolor mode. All the
icons are just white in truecolor mode.
I might be wrong on this point but isn't that so that one must
have a multitasking system to use Jinnee. One multitasking system that
doesn't like Jinnee at all is Geneva. A friend of mine and I have tried it
but no way we could Jinnee get working with Geneva.

Sure Jinnee has some very nice features and consumes much less
memory then Thing does but for the moment nothing can beat Thing.

The SCSI port on falcon is a so called SCSI-2 port (mini Centronix), while
the ZIP has a "system SCSI" (DB) connector. You need a cable or adaptor to
connect them.

simplest way would be to get a 25-pin SCSI to SCSI II adaptor to
put on the end of the cable going in the Falcon; however, it might also
be best to invest in a new cable with the proper leads, as the cable
that comes with the Zip has a history of causing problems with data
transfer on Ataris.

Yes, you need to get a cable to go from the SCSI II on the Falcon to the
zip drive. I use a Zip drive with a Falcon ok using HD Driver to drive
it as Iomega don't supply Atari drivers.

I doubt if you will be able to use mac format zip disks though on the Falcon.

Howdy Paul.

again, this is all personal, but I wouldn't trade my Freedom (2.01) for anything else. Have been working with Selectric for years, but the combination MagiC plus NVDI/Matrix won't let me use it any longer. Running from MagiC was OK, tho'...

Freedom's non-modal, LOOKS good and works 100% here, including long filenames. I've said this before, but the versions of Boxkite I tried all had those Siberian keyboard shortcuts, and I prefer to stick to the "conventions" laid down by others. So Boxkite is out for me, Selectric because of my NVDI version (don't know about the "regular" versions) but Freedom does even more tricks and looks like "1998" in the meantime...

> sure what it's all about. Care to elaborate?

Ease is a brilliant desktop in ways, but it doesn't understand a great deal of the AV Protocol. From jumping back and forth between Ease 4 and Magxdesk 3.23 setups, I've noticed differences in the way some programs react.

AV-Server is an 'auto app' that makes Magxdesk understand more functions of the AV Protocol, which allows programs and accessories to communicate with each other in ways not possible under normal GEM.

More and more of the newer programs are taking advantage of the protocol. aFTP is an example: once you log onto an FTP site, your desktop becomes an extension of that site. Essentially the FTP site's directory window acts as if it's just another partition on your hard-drive. So, to upload and download you can drag-and-drop multiple files to and from both windows. In this case your desktop (the server) interacts through the AV Protocol with aFTP (the 'client' in more ways than one). It's like having a huge Unix server on your desktop ;-)

To best explain what the AV Protocol can do, I've quoted part of Al Fasoldt's excellent article 'Secrets of the AV Protocol':

In general, any AV-aware application can:

* Send messages to a server application (a desktop, for example) to tell it what its status is, in the way of presets and configuration, for example. The server application can then save this information for the AV-aware program or desk accessory.

* Ask another client application to open a window to receive a data file or program file.

* Inform another client application that it has opened one of its own windows.

* Ask a server application what objects are located at different areas of the screen.

* Pass through all keystrokes the client application does not understand, so that the server (desktop, usually) can receive and act on those keystrokes. They could be

function-key macros, for example, even if another
application is in the foreground.

* Ask the server application to start a program and, if
necessary, direct a data file to the new program.

* Inform the server application of the changes to any
directory, so the server can reread its directory windows.

* Receive instructions on what typeface and font size to
use for filenames in directory windows.

* Tell the server application that it is no longer
observing the AV Protocol and is about to shut down, so that
the server can shut down its support for the application
gracefully.

Below are all the AV functions understood by two different desktops.
Thing supports all of these, so that's why I said it's more of a 'modern'
desktop.

Magxdesk 3.23
& AV-Server Ease 4
------------- ------
AV_SENDKEY: Y Y
AV_ASKFILEFONT: N Y
AV_ASKCONFONT, AV_OPENCONSOLE: N N
AV_ASKOBJECT: N Y
AV_OPENWIND: Y Y
AV_STARTPROG: Y Y
AV_ACCWINDOPEN, AV_ACCWINDCLOSED: Y Y
AV_STATUS, AV_GETSTATUS: Y Y
AV_COPY_DRAGGED: N N
AV_PATH_UPDATE, AV_WHAT_IZIT, AV_DRAG_ON_WINDOW: Y N
AV_EXIT: Y N
AV_XWIND: Y N
VA_FONTCHANGED: N N
AV_STARTED: N N
AV_FILEINFO, VA_FILECHANGED: N N
AV_COPYFILE, VA_FILECOPIED: Y N
AV_DELFILE, VA_FILEDELETED: Y N
AV_VIEW, VA_VIEWED: Y N
AV_SETWINDPOS: N N
Provides and uses file name quoting: N N

It's to the point now where some so-called 'modern' applications require
a desktop that fully supports the AV Protocol (or a good part of it). But
that's OK with me because any enhancement to GEM is a good idea. The
drawback is that to keep up to these enhancements one must get a 'modern'
desktop.

Not very easy to answer a general question like that, but it should be
fit to do just about whatever you would want to do with a computer.

For a start, you might want to hang around here or have a look at the
Quick FAQ.

Accelerators for the Mega STE are pretty hard to come by, and so are
graphic cards I'm afraid.

Now I have a 27 inch monitor. I have a trackball with a 10 foot cable so I can sit on the couch and play WEB_TV Atari style.
>

I always wondered why C-Lab didn't have the sense to recase the Falcon to make a WebTV type box. The DSP could have handled the modem part (bear in mind we're talking a few years ago, when speeds were lower and true colour graphics cards on PCs were less common).

I would have shipped it with a minimal hard drive and no floppy - or vice versa - and a customised TOS that dropped you straight into a web browser/email client instead of the GEM desktop. If, however, there was any autobooting software on the hard disk or floppy, that would take precedence - hence you could still update the software, and more importantly, you could add a HDD or FDD and a copy of MagiC or MultiTOS, etc. to get a full computer.

>

As part of my ongoing Falcon rehousing project (rapidly approaching its first anniversary!), I've fitted a PC FDD lead. It works fine, but I wondered if the Falcon would see a second drive if I attached it to the other connector (the post-twist one). I.e. does the Falcon support two physical floppies on the FDD interface, or only one?

From: tj@oro.net
Message-ID: <tj-3107980811330001@i398.oro.net>
Source record: 95910

Although I am not using one on an Atari I am an authorized sales and service provider for Kyocera and the FS-600 is a real nice printer for only $469. 600x2400 dpi using Mac or PC drivers, 600 x 600 dpi using generic drivers, comes HP PCL5 as standard with a parallel port, 2MB RAM expandable to 34MB, 6 pages per minute, upgradeable to postscript and ethernet if needed, etc... Also supports other older matrix printers right out of the box but since most Atari apps support HP drivers, use the HP mode.

Although the printer is made for the PC market, should work on an Atari fine. The nice thing about the Kyocera is "cost of ownership". Running a Kyocera is the least expensive in the industry. They can achieve this since the drum lasts 100,000 pages so for all practical purposes, the only item you would need to replace is toners.

If you want more info, a brochure, or wish to buy one, let me know.

That's probably it. It looked like a GFA error.

>I think only the memory is a limit (see above). I'll try another way
>with a limited number of lines in tne next release.
>
>[...]
>
>Hope so. How many tags did you have before cutting down the file ?

It was around 250, I think -- some of them pretty long (though all
under your line length limit).

If and when you do the next release, can you also have it support the
vertical bar for carriage return in the first line? If you use one
in the first line (i.e. the 'prefix'), it doesn't get converted to a
CR.

Thanks...this is a very cool find.

3821. BEFORE DAWN English docs?

Newsgroup: comp.sys.atari.st
Date: 1998-07-31 00:00:00 UTC
From: ag352@chebucto.ns.ca
Message-ID: <6psp17$or1$1@News.Dal.Ca>
Source record: 95913

Still trying to find a screen saver that will work with my
TT030/NVDI/TTM195 setup.

Based on advice from this newsgroup, I went to the umich FTP site and
downloaded a bunch of files from the BEFORE DAWN directory. Trouble is,
all the docs are German.

I seem to recall that there was an english RSC'd version of this utility,
and it came out on a cover disk back in 1993 or 94, when ST REVIEW and ST
FORMAT were still publishing. Damn. I must have given/lent/lost that cover
disk. Did those files exist, and are they legit pd/shareware these days?
If so, where should one look for them?

And while we're at it, is there a better screen-saver that is TT/NVDI
compatible?

With Magicdesk, i don't know, i never checkt this out.
But it works fine with jinnee or EASE.

>First, I kept getting these messages that the START.SET file was "corrupted".

Yep, modify your START.SET exactly in the same was as shown in
the example START.SET, mostly people forgot to use the TAB key.

Example:

```
# SETUP-Datei fï¿½r Start Me Up!

/small
/backwind
/appline
/shutdown C:\GEMSYS\GEMDESK\SHUTDOWN.PRG
/avnoacc
/tosmultistart
/pop_drag 1000
/sample_boot M:\SAM_16\20THCENT.HSN
/sample_avfail M:\SAM_16\
/sample_boot DING.HSN
/sample_open $tï¿½r
/sample_close $tï¿½r
/sample_start KORKEN.HSN
/sample_term IST_DOLL.HSN
/sample_avfail TJA.HSN
/sample_timer KUCKUCK.HSN

#/drives
/nolabel AB
/shutdown_timeout 2500

/timer 9:10 G:\UPoint\Upoint.PRG

/menu Verzeichnisse
/folder Archive C:\DOWNLOAD
```

```
/separator
/folder AUTO-Ordner C:\AUTO
/folder MagiC-APPS C:\GEMSYS\MAGIC\START
/folder HOME C:\GEMSYS\MAGIC\START
/folder GEMSYS C:\GEMSYS
/folder CPXe C:\CPX
/folder Temporï¿½r C:\CLIPBRB
/end

cut-cut-cut-cut-cut..

Some blanks upper are TABs!
Try it. But watch, that's only a smal example.
My current .SET is much longer.

Regards, Robert

Well, I have a Mega STE 4 with a Hirez screen. Besides some little
utils I use the following software, mainly for professional purposes:

System:
Thing 1.26 (desktop)
NVDI 5 (before this I used gdos and quick ST)
FreeMiNT & Minix (filesystem)
Let them fly
ST guide 1.15

Application software:
Everest (texteditor)
Papyrus 5 (wordprocessor)
LDW Power (spreadsheet)
CS-TeX (Latex2e)

Internet:
HSmodem 7 (necessary to make your 14k4 modem work)
Sting 1.15 (TCP/IP stack and utils)
Newsie 0.89 (email and news)
CAB 1.5 (browser)

Only three programs are commercial. The rest is freeware and
shareware. It serves my purposes very well.
Have fun with your renewed discovery!

Greetings, Kees Wiebering.

It's part of the jpg6btos package.

JPEGTRAN has several very cool features. To clean up the end of pics
(premature EOF), just run it as you would to convert from progressive
to normal jpeg. It doesn't _always_ work, but often it does. I also
recommend you use -optimize, as that will usually knock some size off
the outputted file without losing any picture information.

Mmm.. an STE with 4Mb is quite a desirable beast. To be much good
nowadays you really need a hard disk attached and, if you were to use
it on the net, it would be a good idea to upgrade the serial port.

Many people would find it perfect as a music-machine. This would
exploit those special Atari Midi facilities. But if you are not into
electronic music this isn't a lot of use :-) .... all depends on
your interests really.

Er, not sure , Derek.

Check that you have your paths set up OK (Preferences/Path Options) as
it may be that Newsie does not know where to find/put things.

As an experiment queue a few mails and news items and then look to see
whether they have made it to the 'out' queues. For mail Mail/Open
Mailbox/OUTBOX.MBX. For news News/Open Offline Postbox. If they don't
make it to there you have an internal problem.

Message-ID: <01HW.B1E789D50008FF0E057D4630@news.news-service.com>
Source record: 95925

I have the following items for sale.

Easy Draw Desktop Publishing $20
Pro Copy ST $7.50
Publishing Partner Pro (Pagestream v1.5) $20
Timeworks Data Manager v1.1 $20
Timeworks Desktop Publisher $20
Timeworks Word Writer v2.0 $20
Word Perfect v4.1 $25

All items have both disks and manuals. ProCopy has a slim manual, the rest have very heavy manuals and shipping charges reflect this. All disks are single sided, I no longer have an ST so I have no way to verify the disks. However all software was in full working order last year when I last installed it.

Reply via e-mail if interested.

After setting the time and date at 23:59 31/12/1999 and waiting a couple of
minutes, I tried encrypting/decrypting/signing files with no problems. In
fact the only problem I've found is that the keyboard clock seems unable to
process dates after 1999. PGP has no such problems here.

Perhaps you'd like to detail exactly what's causing the problem so I can
try and reproduce it.

>monochrome.

You are absolutely right. I meant to say that the program appeared to be 100% color-free (not "it only runs in ST HIGH"). Sorry for the mix up.

And in this day and age, when I know what the Falcon is capable of (not to mention the crisp & colorful graphics on the average Windows PC these days), it seems a little disappointing to see a program in all monochrome. It makes me feel like I'm back in the early days of the ST. I know the fact that it's monochrome doesn't affect the quality of what the program does (I use Cubase Audio on my Falcon - 100% monochrome display, but it works great - although it _looks_ rather bad when you compare it to Cubase VST on a MAC or PC (as far as graphics/color is concerned). Sure, you don't _need_ color screens, but I think it really adds to the enjoyment of a program when it has a more modern look (and your PC owning friends don't laugh as much) ;^>

>You can have color around your windows, if you want, by using
>WCOLORS.CPX.

Yes, I know about that. I've used it for a long time - although it tends not to work as well with MagiC. But it doesn't do much to "spice up" a monochrome program. And does nothing to get rid of the "grainy-gray" background associated with "monochrome" programs.

Just my opinion...

Yes, it's a bit of a different setup with MagiC 5 (and all the DOCs refered to MagiC 4), and I'm a _new_ MagiC user, so... I put everything in the GEMSYS\MAGIC\START directory (making sure XMEN_MGR was before SMU - I had it the other way and it didn't work). So, it loads and installs it's "start" icon on the desktop - but all the paths need to be entered by me still - this is the part that seems user-unfriendly (ie. "Hey, for fun, let's type in every single path and directory to every program we might want to use on our 4.29 gig hard drive into a text editor before we can even use the program!). And to think someone _intentionally_ designed it to require this much work! :^\

What _is_ the latest version and where can I find it. I got the one off of Interactive's FTP site, but I don't know if it's the latest or not. (It's version 7.0)

Anyway, thanks for the help!

Well, looks like I'll have to give it a try. Is Freedom (2.01) in English?
Is it shareware or freeware or commercial?
Can you give me an FTP site where I can find it (English v. 2.01)?

>
>Euch, which version of Thing can do this?

AFAIK this started in 1.20, or was it 1.26? Problem is, the time has been
set by the program(mer), so when you drag a file onto another folder it
won't open until you've "been parked there" for somuch time. Usually you
won't even notice the folder opens up, but... if you wanna go deeper than
the folder alone, you need to "hang" for considerable time. Jinnee on the
other hand, lets you select the time in which this happens, so when
configured OK you drag a file into a folder, it opens up, then you can go to
the level you want to... Unless you read the docs carefully you won't even
notice the feature is available in Thing and to my liking it's not done very
practical... Set proper time values in Jinnee and you know what I'm talking
about...

Good thing to know, never noticed it... What I know from a previous version
is that it only linked to the first set assignment...

Hi Paul,

gawd, I don't know any URL for that one. If no one comes up, I'll send it e-mail encoded.
It's not in English and it is.... the docs haven't been translated so go figure... but the prg is OK in English.
AFAIK it's shareware (quite a fee for a Fileselector) but it's not crippled.

Do like I did and ignore the rest... :-) (Yep, I know it's not fair, but on the other hand it's not fair telling people to pay USD 35,- for a fileselector and if you don't pay it "Vee vill shoot down ze world!")

The bottom line is: originally the programmer(s) asked a fee too high, they probably thought they could be H. Hughes' successors in no time, and finally saw their flaws and came down to Earth again. Don't know what the fee is now, but you can at least USE it w/o limitations and then decide whether to pay or not... BTW: dunno what the fee is right now...

3845. Lost Characters (Newsie/MagiC)

Newsgroup: comp.sys.atari.st
Date: 1998-07-31 00:00:00 UTC
From: ecncomr@socal.com
Message-ID: <6ptfet$97b@enews4.newsguy.com>
Source record: 95937

I just noticed something peculiar in NEWSie (running under MagiC 5.11).

Whenever I try to PRINT ARTICLE (be it an e-mail or newsgroup article), the printed output is missing several random characters and some lines are printed on top of others. I haven't changed anything with regard to my printer since installing MagiC a few days ago, and when I PRINT ARTICLE from within NEWSie under regular TOS 4, there are no lost characters.

I'm currently using version .88 of NEWSie (since .90 has that window sizing problem).

Anyone else experience this?

3846. QED Saving

Newsgroup: comp.sys.atari.st
Date: 1998-07-31 00:00:00 UTC
From: ecncomr@socal.com
Message-ID: <6ptfev$97b@enews4.newsguy.com>
Source record: 95938

How do I make QED _not_ keep the last file I was working on? What I mean is that when I edit something in QED (like an e-mail for NEWSie), and then quit the program, when I come back to the program to work on something else, that last file is still there. I don't have AUTOSAVE ticked anywhere either (as far as I can tell). I know it's not a big deal, as QED just opens up another window for the new project, but I don't need it to retain the old file.

3847. QED editing

Newsgroup: comp.sys.atari.st
Date: 1998-07-31 00:00:00 UTC
From: ecncomr@socal.com
Message-ID: <6ptff5$97b@enews4.newsguy.com>
Source record: 95939

Another QED question.

I've been trying several text editors to use with NEWSie. Before NEWSie, I always used and was happy with STeno. However, having tried Everest, Edith, and QED, I must say there are things I like and dislike about all of them.

One thing I like about QED and Everest is that they can use different fonts - STeno can't.

One thing STeno does (that seems like an obvious feature really) is quickly and easily delete a line with SHIFT + DELETE. You put the cursor at the beginning of a line, and hit those keys - BOOM, the line is gone. Very handy, and I'd grown accustomed to that. Now with QED, there doesn't seem to be an equivalent way to do that. All combinations of SHIFT / CONTROL / DELETE / BACKSPACE do nothing like that. One character at a time, or one word at a time with SHIFT seems to be the best QED can do Am I missing something here?

This leads to the next complaint. YES, I know you can just HIGHLIGHT the text and hit DELETE. STeno does this too. But if you have a page or two of text, you have to slowly scroll through it a line at a time with QED. With STeno, you could hold down SHIFT while scrolling to highlight a PAGE at a time - very efficient and useful. Is there a way to do this with QED?

Thanks (still searching for the perfect editor...)

Sounds like Zetnet! Are you abandoning Zetnet, Roy?? If so, why?

I think we should be told....

Hi all!

I've heard that there is an implementation of ICQ for MiNT. How about
one for StiNG?

I have several PC owning friends who're on ICQ and they keep asking if
I will be getting on it.

Anyone know anything?

Cheers!

Nicholas,

(Merci de votre r�ponse! Il me fait toujours plaisir de lire du fran�ais sur
l'internet...eh, ben de toute fa�on, je vais quand m�me continuer en anglais
pour ne pas offenser qui que ce soit:)

Thanks again for your answer.

I wanted to know if there are any internet tools available (browsers and
newreaders) and what the hardware requirements are.

I asked about accelerators because I would assume that 16MhZ wouldn't be
enough horsepower. Also, you mention graphics cards; what might be available,
possibly used?

Finally, where could I grab the FAQ?

Thanks,
Charles McCreary

Hello Nicholas,

b> I'm afraid not, but I'm not sure if there are any benefits in using such
b> a board now that a PII can emulate an ST at a pretty good speed by
b> software only
I have the slower Janus (68000/16(?) MHz) and on my old PC (P100) it was faster than the emulators. On my new PC (K6/233) the emulators (even the DOS
based ones) are faster (don't know, how fast the 68020 version is).

But: If you need a most compatible emulation, the Janus is still a good

choice. It's the most compatible emulation at all (at least, for "normal dirty" programs, not for games).

Greetings, Oliver

First, round the edge that breaks that trace, tape that little wire in place,
and use a drop of either silver or nickel paint (I used General Cement
Nickel Print) to connect the wire to the trace. If there is a break there,
this stuff will find its way in and make connection. If you have scraped
off a lot of the thin green covering, use two drops, one at each end of
the wire

It's a good thing I read this before i went out and put a magnet in my
Falcon. Anyway, why doesn't the Falcon come with one. Is it needed.

Anyway< I solved my RF problem. I connected two wires from the
composite out and ground to a RCA plug to the composite in on my TV.

Now I have WEB_Falcon_TV. The 640x480 true color kinda looks like my
Amiga with all that flickering, but 640x200 ain't too bad. Not good
for anything productive, but good for cruising the net. Now I have a
27 inch monitor. I have a trackball with a 10 foot cable so I can sit
on the couch and play WEB_TV Atari style.

Thanx's for all the help

Magxdesk may be threadbare but it has nuances. After going through a little bit of a 'desktop quandary', I decided to use Magxdesk with AV-Server. I also have an Ease 4 desktop setup with MagiC but tend to use Magxdesk more now, mostly because it supports long filenames and the fact that AV-Server adds seven AV functions that Ease 4 and Magxdesk don't understand. The Thing desktop supports all of the AV protocol, so this is the one to use for a real 'modern' desktop. It really depends on how you want your desktop to interact with other programs. With the help of SMU I've found Magxdesk/AV-Server suits my desktop needs, even though Ease is prettier.

Now I'm going through another quandary: long filenames. I have drive A, one hard-drive partition, and a Zip drive configured to use long filenames but some applications don't support them (like PhotoLine). And I really miss Selectric.

In your MAGX.INF file you'll see a line like this:

#_APP C:\GEMSYS\MAGIC\START\

Just make sure StartMeUp! is in that directory, or whatever path is defined here. By default MagiC doesn't install the correct path pointing to XMEN_MGR -- this threw me off, too. You need XMEN_MGR for MagiC 5.11 to support popup menus, something StartMeUp! uses.

A friend of mine who uses MagiC 4 with Ease recommends Ease (of course). Is Thing shareware and in English? And since I'm new to MagiC, I've heard others mention AV-Server before, but I'm not really sure what it's all about. Care to elaborate?

>Now I'm going through another quandary: long filenames. I have drive A,
>one hard-drive partition, and a Zip drive configured to use long

>I really miss Selectric.

I'm still using Selectric (with MagiC 5) right now, but since MagiC has only been in my possesion for a couple of days, I'm still learning it (and the manual is for version 4, and there are a lot of differences between the two versions). I'm pretty sure I'll have to use either Freedom (never tried it) or the MagiC selector if I want to use the long file names - which I haven't delved into yet...

>In your MAGX.INF file you'll see a line like this:

>to support popup menus, something StartMeUp! uses.

Well, part of the problem was that the DOCs for SMU refer to version 4 of MagiC - and they've renamed a few folders / directories in MagiC 5. So, being new to MagiC in general... aarrgghh!

I _did_ put SMU in the \MAGIC\START folder, then when booting, the dialog came up about XMEN_MGR. So I put _it_ in the START folder also (and other places - trial and error; mostly error!). So far it's not working from

bootup, although I was able to run XMEN_MGR from the desktop, followed by SMU. But since I haven't touched the .SET file, all I get is one "Start" button. (more work for me)

It seems like they'd be able to have some sort of configuration program for SMU so you could easily (using the file selector) set up paths and such. There was mention of some little utility for that, but I'll have to go back and re-read to see what it was.

Anyway, thanks for the help!

Source record: 96080

In article <35bc6b6c.0@news.ptw.com>, starlord@<*>ptw.com (Slc.Dennis Bishop) (starlord@<*>ptw.com (Slc.Dennis Bishop)) stated:

> Is there way to make a print driver for this Brother HL-630
> laser printer that I can use with Print Master???

Since another message noted that Print Master does not have a HP Laserjet-II driver, unless you do find a new print driver (or how to create one) you are stuck with the HL-630's Epson FX-850 emulation.

If you have Print Master set for Epson, but it does not seem to be working right, you may need to explicitly put the HL-630 in emulation mode by sending <ESC> <CR> <E> (decimal = 27 13 69).

Neat setup! I set my fonts real small and used 640x200 when surfing. I think
you can also set the picture to be halfsized so everything looks quite
allright.

My Atari RGB monitor broke down tree years ago, and not until recently have
I got me a VGA monitor. Sure you can use a TV, I used my Falcon with a TV
that time.

Very nicely put Louis, perhaps I'll wait a while and see how the latest
version of Thing! shapes up.

ASH would do well to publish a demo version of the Anglicised Jinnee to give
Thing! a proper run for its money.

>resembling that. I tried creating one, I tried putting XMEN_MGR just about
>every directory I could think of, but SMU won't go any further.

In your magx.inf file there is a line:

#_APP C:\AUTO\APPS\

It might have a different target folder, but this is mine.

Bung Xmen_mgr.prg in there - it's needed for the popup menus that SMU and
very many similar progs use.

> How about a simple instalation program? It _is_ 1998, right?

There is a solution for you, open your web browser to the URL in my sig and
follow your nose.

Take note that the later versions of SMU have additional features that
aren't directly supported but it'll do 99% of the donkey-work for you.

It also doesn't like Freedom so disable that first.

I'd assume that the version of Magxdesk supplied with MagiC 6 would be able
to match the AVServer features of Thing!. Any comments from MagiC 6 users?

I'd also assume that Jinnee would have the same support.

Anyone using one of these on their Atari?

Seems to be a good printer offering emulation of all the common printers, HP PCL5, Epson and PostScript level 2.

How does one followup a newsgroup posting in private email?

Following the obvious step of choosing "Author" from the "Followup/Post Article" dialog box doesn't produce an email in my outbox! :-)

Dear Experts,

I have been using my Iomega Zip successfully to communicate
between two Macs, but would like to use it also for my Falcon.
I found, however, that the Zip cable does not fit the SCSI port
on the Falcon. Is there a simple solution to this problem?

Auctually, they all shipped initially with the single sided drive, then Atari started selling the double sided drives from there storefront. (Forget the name of the company for sure, I think it was Federated Stores).

Then Atari dealers demanded them at the same price they were selling them from since they also were supporting these computers with warrenty repairs, software support, training for the new user, etc..

You could use it for Midi applications..there is a lot of stuff on
the web. The midi interface is already there. I have a Mega Ste, and
that is my primary use, along with my TT030. There are some good
Graphic packages also.
